INTRODUCTION TO INVISIBLE MINERALS

This eBook was originally called *How to Change Your Life with Magnesium*, and it has evolved into an introduction to a type of magnesium that I personally researched, formulated, use, and recommend. It's a Picometer, Stabilized, Ionic Magnesium called [ReMag®](#).

ReMag undergoes a proprietary process where the ions are both rendered small enough and stabilized to readily enter cells. Mineral compounds naturally break down into ions in water, but they immediately bind back up to another ion. The key to the success of ReMag is a unique process of stabilizing magnesium ions, making them 100% absorbed at the cellular level and non-laxative.

NOTE: If you want to immediately skip to the section that tells you how much ReMag to take and how to take it, go to [Detailed ReMag Dosage](#). To find out how to take all the Completement Formulas, go to [Completement Formulas Protocol](#).

Magnesium chloride, extracted from dolomite, is the base mineral compound used to create ReMag. The company that manufactures ReMag sources 99.98 - 99.99% pure magnesium ingots, mined in San Bernardino County, California. These ingots are broken down into picometer, stabilized, ionic liquid minerals. There are as little as 0.01 - 0.02% impurities in our magnesium ingots. This compares very favorably to high quality versions of magnesium citrate that are 98% pure, or magnesium chloride from salt lakes that are 96% pure. The key is that 99.98-99.99% pure is 99.98- 99.99% pure, no matter the source. ReMag is GRAS (generally regarded as safe) and is free of heavy metals on rigorous testing.

Magnesium chloride is a mineral salt crystal in its dry state and breaks down into magnesium ions and chloride ions when dissolved and dispersed in liquid. That's usually all it takes to create ions. However, ionic only speaks to the electrical charge of a mineral. A special proprietary process that stabilizes the magnesium ions is what makes ReMag completely fully absorbed and non-laxative. Proprietary processes are

also used to break magnesium down into a picometer size. I'll explain more about picometers shortly. You can read my manufacturer's words about the process used to make ReMag and its companion multimineral, ReMyte, in [Appendix A](#).

For personal reasons, I had been actively seeking a form of magnesium that is fully absorbed at the cellular level and does not have any laxative effect for a decade before ReMag came to market.

You may be surprised to hear me say that magnesium has a wonderful failsafe mechanism that prevents it from building up in the body – the laxative effect. What's not absorbed into the bloodstream and into the cells after a dose of magnesium is eliminated through the kidneys in the urine and flushes through the intestines as loose stool. My problem was that any form of magnesium in pills or powder gave me a fairly immediate laxative effect. This meant that I'm unable to get enough magnesium into my blood and cells to effectively fight my magnesium deficiency symptoms before it explodes out the other end!! I apologize for being a bit dramatic, but that's what happens to a certain percentage of magnesium users.

When I began using the right type of magnesium, ReMag, I finally found relief for most of my magnesium deficiency symptoms (heart palpitations, charley horses, insomnia, muscle twitching, low back pain, and neck pain) with no laxative effect. Initially, when I encountered this type of magnesium, it was in a form called angstrom magnesium. Angstrom is simply a word that stands for a unit of measurement. One angstrom equals one-tenth of a nanometer (0.1 nm); 100 picometers; or 1/10,000,000,000 (one ten billionth) of a meter (1×10^{-10} m). It even has its own symbol, which is Å, in honor of the Swedish scientist Anders Jonas Ångström, who first named it.

According to Wikipedia, Angstrom, as a measurement, is used in the natural sciences and in technology to express the size of atoms, molecules and microscopic

biological structures, the lengths of chemical bonds, the arrangement of atoms in crystals, the wavelengths of electromagnetic radiation, and the dimensions of integrated circuit parts.

I chose to call the form of magnesium that I now recommend “Pico-Ionic” to bring it into the better known scientific metric system and to stay away from the word “nano,” which has become synonymous with the nanotechnology that many people consider potentially invasive.

ReMag came out of my search for a more concentrated form of angstrom magnesium. The form I was using had 3,000 ppm (parts per million) at a dosage of 45 mg per tablespoon and came in 32 oz. bottles. I had to choke back six tablespoons, two to three times a day to get what I required to keep my symptoms under control.

I’ve been researching how to make Pico-Ionic magnesium more accessible in capsule form. Until they are available, the Pico-Ionic form I use is 60,000 ppm (instead of 3,000 ppm) and comes in 8 oz. bottles of liquid at a dosage of 300 mg per teaspoon. Do the math and you will find that ReMag is 20 times more powerful than angstrom.

ReMag is not a patented product, meaning it doesn’t attract the funding from either government or the drug industry for large clinical trials. What it does have is a mounting array of clinical cases that speak to its tremendous ability to reverse magnesium deficiency and suffering. There is incredible clinical evidence of its amazing therapeutic properties. People have been able to switch from IV magnesium to ReMag and double their magnesium blood levels.

WHAT SCIENCE SAYS

In early 2000’s physicists determined that the mineral ion channels that are the gateways through which minerals enter cells are only 400-500 picometers in diameter.

Ion channels are composed of proteins that form pores through a cell membrane. These specialized proteins help establish and control the voltage traveling across cell membranes, which allows ions to flow along a particular gradient. That may not make a lot of sense to you, but these ion channels are crucial components of the membranes that surround all biological cells and the mineral ions they transport conduct crucial biochemical activity inside cells.

When I was first introduced to picometer minerals and picometer magnesium in particular, I met Dr. Terry Wood, a veterinarian, who was also researching highly absorbable forms of minerals. Dr. Wood was looking for a way to save animals, suffering from pneumonia, that really needed minerals, but their lungs would “drown” if you gave them the necessary minerals in high doses of IV fluids.

When Dr. Wood began using picometer minerals, he found his answer. Either the animal patient lapped up the minerals in a small amount of water or Dr. Wood syringed them down their throats and found they worked even better than IV mineral replacement.

Dr. Wood realized these minerals are almost completely absorbed in the face of a maldigestion and/or malabsorption, since they completely bypass the gut and do not have to be attached to carrier protein molecules that must be digested before the mineral is absorbed.

Dr. Wood told me that another huge point in favor of picometer minerals is that their available surface area is extremely large. If you take a certain amount of a mineral and calculate the surface area, by the time it is broken down into picometer size, the surface area is increased by millions and millions of units. This means there is more mineral surface area available to do its job.

One piece of science that helps validate the efficacy of Pico-Ionic minerals is the electron microscope. A university professor was asked to view the various stages of these minerals, as they were processed, under a microscope, and he found that at

the final stage, his viewing field was blank. The minerals were such a tiny size that they could not be seen. The professor verbally confirmed that our minerals were below picometer in size and because of size would be absorbed 100 percent at the cellular level. However, he was unwilling to sign off on this observation for fear of a backlash from his peers.

REMAg PARTICLE SIZE TESTING

More recently we employed the services of the AVEKA Group, a leader in Particle Processing Technologies. They were sent a sample of ReMag, which is a magnesium chloride compound in a stabilized ionic state and asked to determine particle size.

A summary of the filename, sample name, material ID, and description of what was received is listed below.

Filename	Sample ID	Material	Description
C16-059a	New Capstone Magnesium	Magnesium Chloride	Clear liquid

Particle size analysis was conducted using a Horiba LA-950 laser scattering particle size analyzer. This instrument uses a combination of Fraunhofer and Mie light scattering theory to analyze the size distribution of solid and liquid particles. The size distribution is presented as a histogram, with discrete size bins ranging from 0.03 microns to 3000 microns.

Results: No particles were detected

You may not be able to see ReMag under an electron microscope or via a laser scanning particle size analyzer, but you can surely taste it and notice its effectiveness. Because of their ionic charge, the minerals are “magnetically” attracted to the cell ion

channels. The picometer size means they just slide in without impedance. Picometer-sized, stabilized ion minerals are absorbed directly into cells, therefore, they improve cell function immediately. Minerals are responsible for the 70-90 millivolts of energy that creates intracellular communication. A body can only be as healthy as its cells.

If minerals don't properly get inside cells because they are too large, then non-mineralized water floods into the cells, leaving the large-sized minerals on the outside. All forms of edema, including brain edema, are caused by fluid and electrolyte imbalance at the cellular level. Brain edema is more common than you think. The troops in the Middle East sweat out gallons of water and most of their electrolytes: magnesium, sodium, and potassium. When they just replace their losses with highly sugared and salted water, they are subject to brain edema and errors in judgment that can lead to lives lost in the field.

Another important aspect about Pico-Ionic minerals is that people who suffer from IBS-diarrhea, Crohn's, and colitis can use ReMag without causing a laxative effect.

WHAT IS MAGNESIUM?

Magnesium is a necessary cofactor utilized by 700-800 enzyme systems that perform vital metabolic functions in the body. It took me a whole book, *The Magnesium Miracle*, to describe the intricacies of magnesium physiology. After reading that book, you'll agree that *miracle* is the most suitable word to describe a mineral that treats acid reflux, adrenal fatigue, angina, anxiety, atrial fibrillation, high blood pressure, high cholesterol, constipation, depression, diabetes type 2, fibromyalgia, headaches, heart attacks, IBS, insomnia, kidney stones, migraines, muscle spasms, nerve twitches, osteoporosis, PMS, seizures, and more.

I've just listed many chronic conditions that people are suffering from today, yet has your doctor ever told you to take magnesium? "The answer is probably no."

That's because nutrient therapy is not taught in medical school. Magnesium is not regarded as a first-line therapeutic agent in hospitals or doctor's offices, and it's not a patentable drug. For all these reasons, mainstream medicine remains blind to the extent of magnesium deficiency that is reported to be present in 70-80 percent of the population.

In this book, I'll give you an overview of magnesium and how to use it, some magnesium miracles stories, and answer many of the questions that my clients and readers have had over the years. Let's get started.

MINERAL PARTNERS

Before I go any further, I want to assure you that, even though magnesium is the most important mineral in my universe, it's not the only significant one.

As soon as ReMag became a reality, I began working on a mineral formula, using the same picometer-ionic process. These minerals are not chelates or colloids, and they are unlike anything you've ever heard of before. Using a proprietary process, the minerals are broken down into a soluble form that is the same size as both the minerals absorbed through plant rootlets and the cell mineral ion channels. Direct absorption into our cells does something quite extraordinary – it bypasses the gut.

We hear a lot about faulty gut absorption (called leaky gut) these days. Some practitioners even counsel their patients to not bother taking nutrient supplements until their gut is healed, since they won't absorb them anyway. Besides the fact that they have no way of knowing if that's true, you can't heal your gut without the right nutrients.

In my experience, a yeast-free diet, [ReMag](#), [ReMyte](#), and a good probiotic like [Prescript Assist](#) help treat gut malabsorption and leaky gut. Also, the beauty of picometer-ionic minerals is that they don't rely on an "intact" gut for absorption.

I began creating ReMyte as an electrolyte replacement, but it grew into much more. It includes 12 minerals that go far beyond any electrolyte solution on the market and help solve many of the chronic disease problems that I've been seeing over the past three decades.

Minerals are inorganic substances that your body can't make. You must obtain minerals from the food you eat or as pills, capsules, or preferably liquids.

I've written extensively about the mineral depletion in the agricultural soil where our food is grown, and my conclusion is that food has become the least effective way to obtain your minerals. A normal diet 100 years ago netted you 500 mg of magnesium. Today, you are lucky if you get 200 mg.

Water is supposed to carry the minerals that we require, but the many forms of filtration that we put in place to remove toxic chemicals can also remove important minerals.

Even before medical school, I read everything I could about natural health. After over 45 years of study, I'm convinced that mineral supplementation is the most valuable healing tool you can use. It's the easiest to implement, the most cost effective, and the most valuable for your health.

However, successful mineral therapy all depends on the bioavailability of the minerals you use. If a mineral is not absorbed directly into the cells, it cannot participate in cellular functions, rendering it useless. It can actually be harmful, as you will see below where I write about the problem with excess calcium in the diet and in supplements.

I don't call [ReMyte](#) and my magnesium formula, [ReMag](#), supplements. Instead, I call them Completement Formulas, because they *complete* the body by providing the right minerals in the proper form for optimum function. My Completement Formulas are the culmination of over 45 years of studying the safest, most effective, and revolutionary therapies that are at least 20 years ahead of their time.

I'll explain more throughout this book and in my ReMyte book. Briefly, the conditions plaguing the patients I consult every day often have a basis in hormone imbalance. Thyroid, adrenal, and sex hormones are increasingly drained in our stressed-out society. The best treatment is not hormone replacement; it is mineral replacement. You can obtain a free copy of my ReMyte book, Invisible Minerals – Part II: Multiple Minerals in the [INFO](#) link on the [RnA ReSet](#) website. While you're on the site, you can read about my other amazing products, RnA Drops and ReAline. In a nutshell:

1. ReMag is a form of magnesium that is 100% absorbed at the cellular level, and is non laxative. It successfully treats heart disease, anxiety, muscle pain and spasms, nerve problems, and much more.
2. ReMyte is a combination of 12 minerals that are picometer in size and are fully absorbed at the cellular level, balancing the thyroid, adrenals, and sex hormones.
3. ReCalcium combines picometer, stabilized ionic forms of calcium, boron, and vanadium for people who are unable to obtain 600 mg of calcium per day from their diet.
4. ReStructure is a high protein powder for athletes and Paleo dieters as well as meal replacement for losing weight and balancing blood sugars. Protein is the main ingredient but carbs and fats are also part of the formula for the appropriate macronutrient balance. It's also the perfect meal if you are on a yeast elimination diet. ReStructure contains a "secret ingredient" the concentrated, dehydrated RnA Drops that makes ReStructure the most unique meal replacement you will ever find. Mix with water, coconut milk, almond milk, or your favorite juice for a delicious healthy beverage charged with the power of RnA Drops!
5. ReAline is a very powerful, yet gentle, detoxifier, because it promotes

glutathione production.

6. By far, the most amazing product is the RnA Drops. It's made from barley sprouts (but it's Non-Gluten). RnA Drops make perfect cells and uncover our hidden DNA.
7. ReNew is a skin serum that is made using at least a 25X concentration of RnA Drops (with added Rose Oil) and it's doing miraculous things for scars, wrinkles, and all types of skin conditions.

I'm happily amazed at how my Completement Formulas are changing people's lives, especially when they are taken together. There are many ways to learn more about my work. You can hear testimonials about the Completement Formulas on my radio show, [Dr. Carolyn Dean Live!](#) on Achieve Radio, Mondays at 4pm PST, or you can click on [Studio D](#) on Achieve Radio and hear archives of my show streaming 24/7. On my [RnA ReSet radio archive website](#), You can search several years of my shows for the topics that interest you most.

MAGNESIUM BEGINS WITH CHILDREN

Magnesium was not a topic in my two hours of nutrition classes during my four years in medical school, and it never came up in my clinical work in the hospital. Except for one time, in my third year, I was observing in obstetrics, and a young woman was about to deliver twins. However, her blood pressure was rising, she was bloated with fluid retention, and she was convulsing, with fluid building up in her brain. I wondered what they could give her to stop the seizures, bring down her blood pressure, and get rid of the edema, all while not harming her babies.

Before I knew it, the attending physician ordered an IV bag of magnesium to drip into her veins, and shortly after, her blood pressure came down; she stopped having seizures and started eliminating fluid. It was a monumental experience for me, knowing that the mother and baby were safe because of magnesium! Since I was

already studying nutrition on my own, I also began wondering why magnesium wasn't the first line of therapy for fluid retention, high blood pressure, and seizures for everyone.

Magnesium is a vital component of a healthy pregnancy and delivery. Having enough magnesium during pregnancy can improve the health of our children from day one, but the need for it begins before birth. Magnesium can prevent premature contractions, eclampsia, and greatly reduce the risk of a child suffering cerebral palsy and sudden infant death syndrome (SIDS). Magnesium in effective dosages should be a required supplement for pregnant women.

There are magnesium deficiency symptoms in pregnancy and childbirth that are thought to be normal: constipation, leg cramps, backaches, fluid retention, irritability, and insomnia, to name a few. It's not normal to have these symptoms; instead, it means that these women are not taking enough magnesium.

Magnesium can even help women with fertility problems, because it relieves fallopian tube spasm that can prevent egg implantation!

Therefore, the requirement for magnesium begins from day one of conception and continues through life. Let's explore the reasons we aren't getting enough of this important mineral and what we can do about it.

EXCESS CALCIUM DEPLETES MAGNESIUM

A picture is worth a thousand words. Take a look at the following video explaining the crucial balance of magnesium and calcium. It's on The Nutritional Magnesium Association website (where I serve on the Medical Advisory Board). The video is called [*A Look Inside the Cell*](#) by Andrea Rosenoff PhD (It's the first video under the heading Calcium Magnesium Balance Videos).

We're living in a calcified world, and I'll tell you why. Magnesium controls electrical cell-to-cell communication, allowing the correct amount of calcium to enter

a cell to create cell contraction. This may be one of the hardest tasks set for magnesium, because the level of calcium outside our cells can be tens of thousands of times the safe level allowed inside the cell. Magnesium's job is made even more difficult by so many people taking extra calcium in supplement form and ingesting it in dozens of fortified foods and drinks. They don't realize they need equal amounts of magnesium in the body to bring calcium into proper balance.

See more about calcium dosage in my book on ReMyte, called [*Invisible Minerals Part II – Multiple Minerals*](#).

MAGNESIUM DEFICIENCY CONDITIONS

In *The Magnesium Miracle*, I listed over twenty conditions that are scientifically proven to be associated with magnesium deficiency. These conditions affect both sexes, but women seem to suffer more from magnesium deficiency than men.

When I wrote *The Magnesium Miracle*, Drs. Burton and Bella Altura, two world-renowned magnesium researchers who wrote the foreword in my book, went over this list and approved it. Together, they have produced over 1,000 research papers on magnesium. The Alturas are scientists who had never written a foreword for a popular press book. However, when I approached them, they said that, in spite of their enormous body of research, the message about rampant magnesium deficiency in the population has never translated into clinical application, and they wanted the message to get out. They especially wanted to alert women to the dangers of magnesium deficiency that can begin in the womb.

MAGNESIUM AND MUSCLES

Magnesium relaxes muscle cells and calcium contracts them. Magnesium allows a small amount of calcium into a cell and then forces it out. It's a simple dynamic that

occurs in our bodies every millisecond of every minute, and it's via the muscles that most people learn about magnesium.

We have muscle spasms, muscle twitching, and painful charley horses that turn our calf muscles into rocks when we stretch and turn into muscle aches and pains. We learn to live with them. Then we read about magnesium or hear about it from a friend or a chiropractor, and we use Epsom salts in a bath or take a magnesium pill, causing our muscles to sigh in relief.

Magnesium is to plant chlorophyll as iron is to human hemoglobin. In our body, chlorophyll—with its gift of magnesium—supplies the means to create life-giving energy in our cells. On a practical level, this means that magnesium helps oxygenate our muscles. Also, our cells utilize energy packets called ATP (adenosine triphosphate) with the help of magnesium. Animal studies proved that decreased exercise capacity could be an early sign of magnesium deficiency. When given magnesium, their endurance was restored. Most human studies confirm that any form of exercise depletes magnesium. We sweat it out and stress it out, leading to a need for extra magnesium to neutralize lactic acid.

In fact, it is the most important nutrient for athletes to enhance performance, prevent lactic acid build up, and shorten recovery time. Overworked muscles produce free radicals and magnesium aids in the production of glutathione, the body's super antioxidant. If muscles are deficient in magnesium, they become irritated and on edge, developing tics, twitches, and outright spasms. If you are feeling generally irritated and on edge, magnesium deficiency may be the cause. When you have sufficient magnesium, your muscles are relaxed and your whole body feels calm.

Many of my clients and customers are former athletes who have sweated out and not fully replaced their magnesium stores in years. Even though they are strong competitors and stars in their field, they become anxious and suffer panic attacks as their bodies develop a level of tension and irritability that they can't decipher. Taking

their symptoms to a doctor, they are usually given a prescription of Xanax for anxiety, Prozac or Wellbutrin, and an antipsychotic. In some cases, they are given all three.

Musicians are often as active as athletes in their work. Muscle cramps, anxiety, insomnia, focal dystonia, fatigue, migraines, insomnia, and stress can plague even the most accomplished musician. The treatment for all these conditions is magnesium.

In my experience, fibrositis, fibromyalgia, and chronic neck and back pain may be caused by magnesium deficiency and can be relieved with magnesium supplements to a great extent.

MAGNESIUM AND CIPRO: THEN TO NOW

It's appropriate to write about the Cipro-Magnesium story after the section on Magnesium and Muscles because Cipro's most serious side effects cause damage to tendons and muscles.

Cipro is the short name for Ciprofloxacin, a fluoroquinolone antibiotic used to treat bone and joint infections, intra abdominal infections, infectious diarrhea, respiratory tract infections, skin infections, urinary tract infections, typhoid fever, and as prophylaxis in many surgical procedures. In some countries, Cipro is an OTC medication!

Even though it's used to treat infectious diarrhea, one of the common side effect is diarrhea along with nausea, vomiting, and skin rashes. The most serious side effect is a risk of tendon rupture, permanent peripheral neuropathy and increase muscle weakness. In most countries, fluoroquinolones are not approved for use in children except under narrowly-defined circumstances, because of high rates of musculoskeletal adverse reactions in young test animals.

FDA-approved fluoroquinolones include levofloxacin (Levaquin), ciprofloxacin (Cipro), ciprofloxacin extended-release tablets, moxifloxacin (Avelox), ofloxacin and gemifloxacin (Factive); they are taken by more than 26 million Americans each year.

In 2004, the FDA warned about permanent peripheral neuropathy, By July 2008, it had added a Boxed Warning for the increased risk of tendinitis and tendon rupture. On May 12, 2016, the FDA demanded a stronger black box warning regarding these side effects and advised that they not be used for sinusitis, bronchitis, and uncomplicated urinary tract infections in patients who have other treatment options.

I first became aware of Cipro during the Anthrax postal scare that began in 2001, one week after 9/11. Letters containing anthrax spores turned up at several news media outlets and two Democratic senators offices. Five people were killed and 17 more were infected, and everyone was scared. The treatment of choice for Anthrax was Cipro, and countless people took Cipro prophylactically.

I receive emails every day from people who are suffering the side effects of the antibiotic Ciprofloxacin. Here are a few with a host of questions that I will answer.

“My wife, age 55 was put on Cipro for a UTI. We are both Physical Therapists. I warned her about my experiences with patients taking Quinolones and having tendon rupture but she puts her trust in her doctor who prescribed the meds and is taking them. She is allergic to sulfa and one other antibiotic...thus the Cipro. I read your article on magnesium and wanted to know if she should start that now since she just began her first dose of Cipro today. Will the magnesium interfere with the effectiveness of Cipro against the bacteria?”

“I had to take 2x500 mg Ciprofloxacin for 10 days, a huge dose, only to treat a middle ear infection. Now, 10 days after the last pill I have strong pain in all of my tendons and can hardly move, further I get periods of depression. Now that I learned about the horrible side effects I would like to ask you some questions please: Can you tell me what causes the side effects?”

Cipro is a fluoroquinolone. Fluoro- stands for the fluoride molecules attached to quinolone to make the drug stronger. Fluoride drugs cross the blood brain barrier and irritate the nervous system. That alone is enough reason not to take them but a

further insult is that fluoride molecules bind with magnesium making you magnesium deficient. The resulting compound, MgF, called selliate, is a brittle compound that deposits in bones and tendons. The double whammy of fluoroquinolones is your muscles are tense and in spasm because of magnesium deficiency and selliate can cause them to be brittle to the point that tendons can snap. It's obvious to me that magnesium deficiency may be an underlying cause of Cipro toxicity.

I've heard researchers say that in the lab, fluoroquinolone drugs do not break down and lose their fluoride attachment. However, gut researchers say that when the drugs hit the intestines, the trillions of bacteria can perform that function of releasing fluoride molecules to the blood stream.

"What can you do treat those side effects?"

I personally would saturate myself with magnesium and I recommend magnesium to my clients. I also recommend getting a baseline Magnesium RBC blood test to determine magnesium levels. Be aware, however, that the range for this test is 4.2-6.8 mg/dL in the present population that is 80% magnesium deficient. The optimum range that I would want for my body is 6.0-6.5 mg/dL.

"What role does Magnesium play in all of this?"

Magnesium deficiency is the cause, and magnesium is the treatment. It's likely that people who are already magnesium-deficient are more susceptible to fluoroquinolone poisoning. The type of magnesium should be well absorbed and not cause a laxative effect because you want to take large enough doses to get a therapeutic amount. The magnesium that I use and recommend to is ReMag.

To answer the first question from the Physical Therapist, I would personally start taking magnesium while I was taking a drug that contains fluoride. Just take the drug and the magnesium a few hours apart. The sooner you begin taking ReMag, the more likely you will have a good recovery. Unfortunately, Cipro side effects can be

cumulative, which means that people who have had several courses of Cipro can have severe problems.

I also recommend that people detox with a safe glutathione precursor such as the sulfur-based amino acid, methionine found in [ReAline](#). This capsule also contains methylated B vitamins including folate and Vitamin B12.

To learn what drugs have fluoride molecules, google the name of the drug and the words 'chemical formula.' If the formula has fluoride, the F symbol will be displayed.

MAGNESIUM AND HEART DISEASE

Magnesium deficiency is very common in people with heart disease. In hospitals where doctors understand the importance of magnesium, it is administered for acute myocardial infarction and cardiac arrhythmia. Like any other muscle, the heart requires magnesium. Magnesium is also used to treat angina, or chest pain.

The epidemic of heart disease in women may have its origins in the excessive intake of medically prescribed calcium. In fact, several studies in the British Medical Journal (BMJ) recently proved that women who take calcium supplements have a higher risk of heart disease, stemming from calcium deposits in their arteries.

When heart muscle cells have too much calcium on the inside, they can go into a life-threatening spasm that we call "heart attack." When they have enough magnesium, the heart muscle cells relax. The prescription medication to prevent calcium build-up is called a "calcium channel blocker." Nature's calcium channel blocker is magnesium; it's the guardian angel of the heart. The most commonly used drugs in high blood pressure are diuretics. The irony of using diuretics is that they deplete the body of magnesium.

In June 2008, Tim Russert, a well-known and respected journalist, died suddenly and unexpectedly of a heart attack. I wrote a version of the following article

shortly after his death. I think it's an important overview of the current position of modern medicine on heart disease and its inability to make headway in treating this condition.

Millions of people around the world are in the same position as Russert: high cholesterol, high blood pressure, and on several medications to avoid having a heart attack. However, the treatments for high blood pressure, high cholesterol and high blood sugar all deplete magnesium and worsen these three very common conditions.

Many of you will see yourself in this picture, and now you know what steps you can take to prevent yourself from becoming a statistic.

WHY DIDN'T TIM RUSSERT TAKE MAGNESIUM?

The death of Tim Russert struck a deep cord in the *hearts* of millions of Americans who await the seemingly inevitable visit to a cardiac ward.

Let's look at the facts of Russert's death. He was known to have high blood pressure, high cholesterol, and asymptomatic coronary artery disease, which means he had calcium/cholesterol plaque building up inside the arteries of his heart with no chest pain. He was on medications for hypertension, which have a known side effect of draining the body of magnesium. He was also on statin drugs for high LDL and triglycerides, and low HDL.

On medication, his good cholesterol (HDL) rose from the 20's to 37, which, according to his doctors, was an "acceptable lipid profile". Russert also had minimally elevated blood sugar, but did not have diabetes (yet) and wasn't on drugs for diabetes (yet). Apparently, Russert's stress test in late April 2008 was normal, so his heart was thought to be in good shape. Two months later, he was dead.

The first question is: why did Russert die if he was in the capable hands of medical experts and on FDA-approved drugs for his condition? Also, why, with all their

expertise and all their medical education, did his doctors neglect what the heart and body really need in a proper diet with natural and effective supplements?

Modern medicine thinks it's smarter than the human brain and body. It theorizes that the heart muscle is getting too much calcium and gives it a calcium channel blocker, when the first thing it needs is magnesium. Modern medicine thinks the body has too much fluid, so it prescribes a diuretic to lower blood pressure. However, this ends up flushing out magnesium and potassium, causing a vicious cycle of mineral loss. Modern medicine thinks cholesterol is the bad guy and the cause of all our ills (which it is not), and gives the body drugs that knock out our body's ability to make cholesterol, all while causing numerous side effects.

In my 200 hours of biochemistry in medical school, I learned, and every other doctor who stayed awake in class learned, that every one of the thousands of metabolic functions in the body absolutely requires one or more vitamins and minerals in order to proceed to the next biochemical reaction. It's very simple and very basic yet it is very much forgotten by most doctors.

However, instead of learning about the body's needs, we were taught to diagnose disease and treat disease symptoms with drugs or surgery. That's our mandate, and in the past 100 years, no other system of health care has been powerful enough to suggest any other approach to disease.

Everyone wants good health, but health is not just the absence of disease. Health involves the intake of natural vitamins and minerals that are, for the most part, absent from the soil. If they're not in the soil, then they are absent from our food, and they are especially absent if we eat fast foods and drink artificially-sweetened beverages. Besides giving us the necessary building blocks for a healthy body, these nutrients, especially magnesium, can protect us from high blood pressure, high cholesterol, and high blood sugar. Why wait until you are symptomatic to take a drug when you can prevent the condition in the first place?

MAGNESIUM IS A NATURAL STATIN

Magnesium uses the same mechanisms as statin drugs to lower cholesterol.¹ Every metabolic activity in the body depends on enzymes. Making cholesterol, for example, requires a specific enzyme called HMG-CoA reductase. Magnesium slows down this enzymatic reaction when it is present in sufficient quantities. HMG-CoA reductase is the same enzyme that statin drugs target and inhibit. The mechanisms are nearly the same; however, magnesium is the natural way that the body has evolved to control cholesterol when it reaches a certain level, whereas statin drugs are used to destroy the whole process. This means that if sufficient magnesium is present in the body, cholesterol will be limited to its necessary functions—the production of hormones and the maintenance of cell membranes—and will not be produced in excess.

It's only in our present-day circumstances of magnesium-deficient soil, little magnesium in processed foods, and excessive intake of calcium and calcium-rich foods (without supplementation of magnesium) that cholesterol has become elevated in the population.

Magnesium is also responsible for several other lipid-altering functions that are not even shared by statin drugs. It is necessary for the activity of an enzyme that lowers LDL, the “bad” cholesterol; it also lowers triglycerides and raises the “good” cholesterol, HDL. Another magnesium-dependent enzyme converts omega-3 and omega-6 essential fatty acids into prostaglandins, which are required for heart and overall health.

At least 18 human studies have verified that magnesium supplements can have an extremely beneficial effect on lipids. In these studies, total cholesterol levels were reduced by 6 to 23 percent; LDL (bad) cholesterol was lowered by 10 to 18

¹ Rosanoff A, Seelig MS, “Comparison of mechanism and functional effects of magnesium and statin pharmaceuticals.” J Am Coll Nutr, vol. 23, no. 5, pp. 501S–505S, 2004.

percent; triglycerides fell by 10 to 42 percent; and HDL (good) cholesterol rose by 4 to 11 percent. Furthermore, the studies showed that low magnesium levels are associated with higher levels of “bad” cholesterol and high magnesium levels indicate an increase in “good” cholesterol.

DO STATINS PROLONG LIFE?

The *New York Times* in January 2008 asked the question on everyone’s lips, “Do statins prolong life?”² The answer for most people with heart disease is simple; no, they do not.

Dr. Mark H. Ebell, a professor at the University of Georgia and deputy editor of the *American Family Physician*, says, “Patients at low risk benefit very little if at all. We end up overtreating a lot of patients.”

Doctors are still trying to decide why that is the case. They prescribe statins because they lower cholesterol, and some want these drugs to be used as a preventive measure for the whole population. One thing they tend to ignore is that the accumulated side effects are worse than the “cure”. They are too busy treating the cholesterol and not the patient. It’s like the old medical joke, “The surgery was a success, but the patient died.”

The Times reported that a 2006 report, in *The Archives of Internal Medicine*, was an analysis of seven statin trials in nearly 43,000 patients, mostly middle-aged men without obvious heart disease. In that analysis, statins did not lower mortality. The same results were found in a misnamed study called Prosper, published in *The Lancet* in 2002, which studied statin use in people 70 and older. A third 2004 review, in the *Journal of the American Medical Association*, looked at 13 studies of nearly 20,000

² Parker-Pope Tara. "Great Drug, but Does It Prolong Life?" *New York Times*. January 29, 2008.

women, both healthy and with established heart disease, and found no benefit. Yes, the cholesterol may decrease, but that doesn't guarantee longevity.

The other measure of success with a drug is if it improves a person's quality of life. Statin critics say there is no evidence that statin users have a better quality of life. In fact, the quality of life may be worsened by statins because most doctors continue to ignore or don't recognize the side effects of statins instead threatening them with other drugs. Muscle pain is treated with anti-inflammatories, impotence with Viagra, and mood symptoms with antidepressants. All these drugs, of course, have their own side effects.

NOT IN ACCORD WITH OUR BODIES

A diabetes trial called ACCORD was halted, because people on this intensive triple drug treatment were dying.³ The trial was designed to test the effects of intensive blood glucose control, intensive control of blood lipids, and intensive control of blood pressure. "Intensive" in this trial meant high-dose medications, not exercise, not diet, not supplements, just medications.

After four years, 257 participants in the intensive treatment group had died, compared with 203 in the standard treatment group. The study was halted, because the treatment was killing people.

Here's a very common story I hear from clients and customers (let's call this typical client Jack). Jack is 60, and he goes to his doctor for his annual checkup who finds that his blood pressure is a little high (probably from stress and low magnesium levels). He is immediately put on a diuretic drug. When he comes back the next time, his pressure is higher. The doctor doesn't know why, but it's because Jack's magnesium is driven even lower by the diuretic. His doctor just thinks he's caught

³ Major diabetes trial halted after deaths: 257 patients died after intense therapy to lower blood sugar, NIH reports. Associated Press. Feb. 6, 2008.

Jack's blood pressure early and has to get more aggressive. The doctor puts Jack on a second antihypertensive drug. A month later, seemingly out of the blue, but because of lower levels of magnesium, his cholesterol levels are elevated. The doctor, therefore, puts Jack on a statin drug.

Another month passes, and his blood sugar level is starting to climb. Without anybody even questioning why, Jack's doctor puts him on a diabetic drug. One of the recognized signs of diabetes is low magnesium, but that's not even considered. By now, Jack is on four drugs to treat an underlying magnesium deficiency, all of which are causing severe magnesium deficiency. Jack is also scared to death that he has heart disease, and he is afraid to stop his drugs.

In this whole sixth-month scenario, magnesium levels are never tested. However, even if some bright young resident runs a magnesium test, it will be the wrong one, because only one percent of the body's magnesium is in the blood. Magnesium in the blood is crucial, and the amount is guarded by powerful feedback mechanisms, meaning it will usually look normal unless the levels in the tissues are dangerously low. Because magnesium levels always seem to be normal it's not even a routine test in most hospitals. A more accurate test is the RBC magnesium test, which measures 40 percent of the body's magnesium. The best test is still only available as a research tool, and it is known as an ionic magnesium test.

MAGNESIUM IS NATURE'S CALCIUM CHANNEL BLOCKER^{4,5,6}

Calcium enters the cells of the heart by way of calcium channels that are jealously guarded by magnesium. Magnesium in the cells is kept at a concentration 10,000 times greater than that of calcium. It allows only a certain amount of calcium to enter cells to create necessary electrical transmissions, and then it immediately ejects the calcium once the work is done. Why? If calcium accumulates in the cell, it causes hyperexcitability and calcification, disrupting cell function and leading to angina, high blood pressure, arrhythmia, asthma, headaches and even heart attacks.

Intensive drug therapy, in case you haven't heard, is not working. It didn't work for Tim Russert, and it may not work for you. Wouldn't it make sense to have a study that compares people on drugs with people on a proper diet, supplements and exercise? However, most clinical trials are funded by drug companies, simply comparing people on different drugs. Therefore, it's up to you to take care of your own health by studying the natural treatments of heart disease, starting with magnesium!

MAGNESIUM FOR ANXIETY AND PANIC ATTACKS

Magnesium deficiency can produce manifestations of anxiety that include anger, anorexia, apathy, apprehension, confusion, eye twitches, fatigue, insomnia, muscle weakness, nervousness, poor concentration, poor memory, racing heart, and trembling. I've seen formerly accomplished and competent people melt into puddles of tears when they develop anxiety and panic attacks.

⁴ Levine BS, Coburn JW, "Magnesium, the mimic/antagonist of calcium." *N Engl J Med*, vol. 310, pp. 1253–1255, 1984.

⁵ Iseri LT, French JH, "Magnesium: nature's physiologic calcium blocker." *Am Heart J*, vol. 108, pp. 188–193, 1984.

⁶ Seelig MS, "Cardiovascular reactions to stress intensified by magnesium deficit in consequences of magnesium deficiency on the enhancement of stress reactions; preventive and therapeutic implications: a review." *J Am Coll Nutr*, vol. 13, no. 5, pp. 429–446, 1994.

One of the main triggers creating panic attacks is low blood sugar. Here's how it happens. You're late for work, and you grab a coffee and donut. Your blood sugar and adrenaline soar, propelling you into your day. However, on the drive to work, your blood sugar crashes. When that happens, your adrenal glands are triggered to release adrenaline to break down sugar stored in your liver, keeping your brain from starving and sending you falling to the floor in a faint. However, the adrenaline surge makes your heart race and your palms sweat in a "fight or flight" response. Sitting at the wheel of your car, you can't run off the feeling, so your mind starts racing instead, spinning into a cycle of worry and panic. If you're crossing a bridge at the same time, you can even develop a phobia of bridges and high places. If you go to the doctor, you will be given a prescription for Xanax and a diagnosis of panic disorder, all with no mention of your blood sugar. Your life will never be the same because you feel your mind has betrayed you and you can't trust yourself anymore.

If your doctor asks you if you've felt down lately, had trouble sleeping, and felt you are under too much stress, you may be offered an antidepressant like Prozac. See the section [Magnesium for Depression](#) for more information on serotonin and Prozac.

MAGNESIUM FOR ASTHMA

Both histamine production and bronchial spasms increase with magnesium deficiency. Magnesium helps reduce histamine levels, and it relaxes the smooth muscles lining the bronchial tract. Breathlessness, wheezing, and sweating are stressful activities; asthma, itself, is a major stress, and all that adds up to more magnesium being lost and increased symptoms.

We've probably all had the experience of laughing ourselves to the point of wheezing. Wheezing is a mechanical function of the bronchial tubes going into spasm. A lack of magnesium can make muscles cramp and go into spasm. We can't see it happening directly, but we feel it when our bronchial tubes react. If you inhale a

substance to which you are allergic, your nose tries to sneeze it out, and your lungs try to cough it out. If you are magnesium deficient, your bronchial tubes start spasming after a certain amount of coughing and gasping for air.

The mechanical aspect of asthma can be treated with magnesium. It's that simple. It's not going to stop you being allergic, but your lungs will be stronger and not go into spasm so easily. You'll be able to take those deep breaths that you need to expel the allergic substance without your lungs cramping and shutting off your air supply.

I've been getting reports of people using two ounces of ReMag in their nebulizers. I haven't recommended or prescribed that usage, but people who decide to do this on their own say it has stopped their asthma attacks! I guess that, since we are breathing in so many nasty things, why not breathe in something that will help!

MAGNESIUM FOR BLOOD CLOTS

Magnesium has an important role to play in preventing blood clots and keeping the blood thin—without any side effects. In *The Magnesium Miracle*, I talk about the importance of balancing calcium and magnesium in the body. There's a simple experiment you can do to show this. Stir a half-teaspoon of calcium powder in a glass of water. You'll see that it won't fully dissolve. Then, add a half-teaspoon of magnesium powder, and miraculously, the magnesium dissolves immediately and makes the calcium flakes disappear.

Well, the same thing happens in your blood stream. Calcium doesn't dissolve in the blood, and it's a well-known fact that it promotes blood clotting. However, magnesium dissolves calcium along with the unnecessary blood clots that calcium produces.

Of course blood clotting is a necessary function when you get injured or need to heal from surgery, and calcium initiating clotting is only one of the factors involved.

However, if you are on magnesium, it will never mean that you won't clot anymore. What this means is that having enough magnesium will prevent abnormal clotting.

The anticoagulant drug, Plavix, works on another aspect of blood clotting. It inhibits platelet aggregation. What you aren't told is that platelets are activated by calcium. This drug stops platelets from functioning, when the simplest thing to do would be to cut back on calcium supplements and balance the extra calcium with magnesium.

Plavix, which was only approved by the FDA in 1997 for minimal use in unstable angina and people who had heart attacks, had its indications expanded very broadly only a few years ago, in 2002. It's now on the long list of drugs that anyone with any sort of heart problem is prescribed. Patients are being told that it will prevent stroke and heart attack.

However, the "post marketing surveillance" has finally caught up with it. The side effects, which number over 80, and the drug interactions are adding up. The FDA, in November 2009, warned that many drugs interfere with the action of Plavix. These drugs, so far, include Nexium, Prilosec, Tagamet, Prozac, Sarafem, Symbyax, Luvox, Ticlid, Diflucan, Nizoral, VFEND, Intelence, and Felbatol.

It's the perfect time for the FDA to announce that taking magnesium could probably do as good a job as Plavix, all without the side effects, but that's a dreamscape scenario at this time. Modern medicine is wedded to the standard practice of medicine: drugs and surgery. Unfortunately for unsuspecting millions of patients, supplementing with magnesium has no part in that fantasy production, yet.

MAGNESIUM FOR BONES

The use of calcium with vitamin D to enhance calcium absorption (without a balancing amount of magnesium) causes further magnesium deficiency, which can trigger a cascade of events leading to bone loss. However, every woman past 45 is told that in

order to prevent osteoporosis, she should take massive amounts of calcium, all while not being offered magnesium. If calcium is the solution, why do we still have an epidemic of osteoporosis?

Magnesium deficiency causes an unhealthy balance of phosphorus and calcium in saliva, which damages teeth as well.

MAGNESIUM AND BOWEL DISEASE

Magnesium deficiency and calcium excess cause the muscles of the intestines to contract and not relax. Contracting and relaxing of the intestines is the way that food moves through from mouth to anus. If the intestines are stuck in the contracting phase, the bowels slow down and cause constipation. The symptoms of constipation include malabsorption of nutrients, abdominal pain, and toxicity symptoms like headache, foginess, dizziness, fatigue, and depression.

However, it's not all about constipation. Painful bowel spasms, common in IBS-diarrhea and colitis, can also mean a magnesium deficiency, but the type of magnesium used for those symptoms must be the non-laxative form of magnesium – ReMag.

MAGNESIUM FOR CYSTITIS

Bladder spasms are made worse by magnesium deficiency, and they can make a bladder infection feel like a medical emergency. The lining of the bladder has smooth muscles that are affected by magnesium, just like any other muscle. Lack of magnesium doesn't cause a bladder infection, but if these muscles are cramping, it can actually make you think you have a bladder infection when you do not. One woman in her late seventies reported that, after 3 months on magnesium, she was able to throw out her adult diapers, because she was no longer incontinent. She

praised magnesium for dissolving what she thought was calcium in her bladder, making it too rigid to hold urine properly.

MAGNESIUM FOR DEPRESSION

Prozac is a serotonin reuptake inhibitor, which is a fancy way of saying that it stops the breakdown of serotonin, the brain chemical that enhances mood. However, taking Prozac can actually give you levels of serotonin that are too high, which is not beneficial. The good news is that serotonin depends on magnesium for its production and function, so, if you have enough magnesium, chances are high that you will have enough serotonin.

A magnesium-deficient brain is also more susceptible to allergens, chemicals, and other foreign substances that may cause symptoms similar to mental illness.

MAGNESIUM FOR DETOXIFICATION

Magnesium is crucial for the removal of toxic substances; heavy metals, such as aluminum and lead; and excess minerals, like calcium, from the body. Detoxification doesn't mean a visit to the Betty Ford Clinic; it's a necessary body activity. The liver has several detoxification pathways, and many of them depend on magnesium for their proper function.

MAGNESIUM FOR DIABETES

Magnesium deficiency is a risk factor for diabetes. Magnesium enhances insulin secretion. Without magnesium, insulin is not able to transfer glucose into cells. In diabetes, glucose and insulin build up in the blood, causing various types of tissue damage. Magnesium also facilitates sugar metabolism, helping simple and complex carbohydrates to break down.

Medically, magnesium deficiency is a sign of diabetes, but most doctors are not aware of this association. However, many of my clients report that, when they start taking magnesium, their blood sugar levels stabilize, with no other intervention.

MAGNESIUM FOR FATIGUE

Fatigue is one of the most common complaints that people have. We all seem to want more energy. If you go to your doctor and say, “I’m tired, what’s wrong with me?” Your doctor may check your blood and tell you you’re fine, but maybe you’re depressed. They may then offer you an antidepressant. However, if you take magnesium, you may find that it’s not depression at all; it’s a lack of ATP!

An early symptom of magnesium deficiency is fatigue. Magnesium-deficient patients commonly experience fatigue, because dozens of enzyme systems are under functioning. The most important one is the ATP system. ATP stands for adenosine triphosphate, and it is the basic energy molecule in our body. Magnesium attaches to ATP, stabilizing it and making it available for use. If you don’t have enough magnesium, then ATP is not properly produced.

MAGNESIUM FOR HYPERTENSION

All our blood vessels are lined with smooth muscle. When magnesium is in short supply, the blood vessels can go into spasm. The decreased diameter of the blood vessel, caused by this constriction and spasm, can automatically cause the most common type of high blood pressure. The only way to relax that spasm is with magnesium. Taking diuretics to lower the amount of fluid in the bloodstream doesn’t address the real underlying cause of the problem. Cholesterol build up in the arteries of the body can also decrease their volume and cause increased blood pressure. However (wouldn’t you know it), magnesium helps lower cholesterol as well! I cover cholesterol in detail in the section, [*Why Didn’t Tim Russert Take Magnesium?*](#)

MAGNESIUM FOR INSOMNIA

There are many causes of insomnia, several of which can be triggered by low magnesium levels. Low magnesium creates muscle tension and cramping. Going to bed with tight muscles is more conducive to a restless night than a deep sleep. Also, stress and anxiety can cause the adrenal glands to misfire and be trigger-happy. You know you're in that category when you jump at loud noises and your heart starts racing. If that's the case, an exciting dream can speed up your heart and wake you up. What's even worse is that, without enough magnesium, your sleep-regulating melatonin production is disturbed, and it's difficult to get to sleep or stay asleep.

MAGNESIUM FOR MIGRAINE

In medical school, I learned that migraines are incurable and can only be symptomatically treated with strong pain medications. We were also told that migraine patients walked a fine line between becoming addicted to their pain meds and having some control over their pain. In my medical practice, I remember patients telling me that if they could catch their migraine soon enough with enough drugs, they might be able to stop the pain. However, they said they felt zonked out for a day or two after because of the drug side effects.

Even with all our medical advances, we still don't know what causes migraines. They are thought to be due to an imbalance in brain chemicals that can lead to inflammation. This low-grade inflammation can cause brain blood vessels to swell and irritate nearby nerves, and causing pain. However, what the researchers are not considering is that magnesium deficiency will make the smooth muscles of blood vessels more irritable and susceptible to inflammation. The same thing happens with nerves. In magnesium deficiency, nerve cells become more irritated. It all makes sense, if you consider magnesium deficiency as an underlying trigger to migraines,

and as you will read in the [Magnesium Miracle Stories](#) below, magnesium can help you get rid of migraine headaches forever.

Serotonin production is magnesium-dependent, and a deficiency of serotonin can result in migraine headaches and depression. However, it's a toss-up whether the serotonin reuptake inhibitors, like Prozac, actually cause headaches or cure them.

The list of triggers for migraine read like my list of [100 Magnesium Deficiency Factors](#) below.

- Alcohol
- Aspartame (NutraSweet® and Equal®)
- Caffeine
- Food Additives [nitrates, MSG (monosodium glutamate), and tyramine, (found in aged cheeses, soy products, sausages, smoked fish, and Chianti wine)]
- Hormonal changes
- Skipping meals
- Sleep imbalance (too much or too little)
- Strong sensory stimulation (bright lights, loud noises, and/or strong odors)
- Stress and anxiety
- Weather changes

MAGNESIUM FOR NERVE PROBLEMS

Magnesium alleviates peripheral nerve disturbances throughout the body, such as headaches, muscle contractions, gastrointestinal spasms, and calf, foot, and toe cramps. It is also used in treating central nervous system symptoms of vertigo and

confusion. Diabetic neuropathy is a very painful aspect of diabetes. Research shows that magnesium can relieve some of the symptoms of this condition.

MAGNESIUM FOR OBSTETRICS AND GYNECOLOGY

Magnesium helps prevent premenstrual syndrome and dysmenorrhea (cramping pain during menses); is important in the treatment of infertility; and it alleviates premature contractions, preeclampsia, and eclampsia in pregnancy. Intravenous magnesium is given in obstetrical wards for pregnancy-induced hypertension and to lessen the risk of cerebral palsy and sudden infant death syndrome (SIDS). Magnesium should be a required supplement for pregnant women.

SIGNS AND SYMPTOMS OF MAGNESIUM DEFICIENCY

The most frequent questions I'm asked about magnesium are: "How do I know I need more magnesium?" and, "Should I take magnesium supplements?" I have come to the conclusion that everyone could benefit from extra supplementation.

The following **100 Magnesium Deficiency Factors** in 68 categories can help you recognize a possible magnesium deficiency. If you have any additions to this list, please let me know. For example, a client recently told me that her chronic hiccoughs went away when she started supplementing with magnesium. There's no way of knowing how many factors correlate with any one person's magnesium deficiency, but if you find yourself ticking off more than a dozen, you may want see how many of your symptoms improve when you take magnesium supplements.

HUNDRED MAGNESIUM DEFICIENCY FACTORS - *THE MAGNESIUM MIRACLE (2014)*

1. Alcohol >7 drinks per week	2. Anger	3. Angina
4. Anxiety	5. Apathy	6. Arrhythmia
7. Asthma	8. Blood tests a. Low calcium b. Low potassium c. Low magnesium	9. Bowel problems a. Undigested fat in stool b. Constipation c. Diarrhea d. Alternating constipation and diarrhea e. IBS f. Crohn's g. Colitis
10. Brain trauma	11. Bronchitis, chronic	12. Caffeine (coffee, tea, chocolate) > 3 /day
13. CFS (Chronic Fatigue)	14. Cold limbs	15. Concentration difficulties
16. Confusion	17. Convulsions	18. Depression
19. Diabetes a. Type I b. Type II c. Gestational	20. Fibromyalgia	21. Food intake imbalances a. Limited in green leafy vegetables, seeds, and fresh fruit b. High protein
22. Food cravings a. Carbohydrates b. Chocolate c. Salt d. Junk food	23. Gagging or choking on food	24. Hand Tremor
25. Headaches	26. Heart disease	27. Heart rate—rapid
28. High BP	29. Homocysteinuria	30. Hyperactivity
31. Hyperventilation	32. Infertility	33. Insomnia
34. Irritability	35. Kidney stones	36. Medications a. Digitalis b. Diuretics c. Antibiotics d. Steroids e. Oral contraceptives f. Indomethacin

		g. Cisplatin h. Amphotericin i. Cholestyramine j. Synthetic estrogens
37. Memory impairment	38. Mercury amalgam dental fillings	39. Menstrual pain and cramps
40. Migraines	41. Mineral supplements a. Calcium without magnesium (Mg) b. Zinc without Mg c. Iron without Mg	42. Mitral Valve Prolapse
43. Muscle cramps or spasms	44. Muscle twitching or tics	45. Muscle weakness
46. Numbness of hands or feet	47. Osteoporosis	48. Paranoia
49. Parathyroid hyperactivity	50. PMS	51. Polycystic ovarian disease
52. Pregnancy a. Currently pregnant b. Pregnant again within one year c. Preeclampsia or Eclampsia d. Postpartum depression e. Have a child with cerebral palsy (mother mg deficient)	53. Radiation therapy	54. Raynaud's syndrome
55. Restlessness	56. Sexual energy diminished	57. Short of breath
58. Smoking	59. Startled by noise	60. Stressful life
61. Stroke	62. Sugar, high intake daily	63. Syndrome X
64. Thyroid hyperactivity	65. Tingling of hands or feet	66. Transplants a. Kidney b. Liver
67. Water Additives a. Fluoride b. Chlorine c. Calcium	68. Wheezing	

WHERE HAS ALL THE MAGNESIUM GONE?

Even though magnesium is the most important mineral in our body, farming practices have depleted the soil of magnesium, making our food, and our bodies, magnesium-deficient. One hundred years ago, you could obtain 500 mg of magnesium in your diet per day. Now, that figure has been reduced to 200 mg.

Most farmers do not remineralize their soil, instead they use fertilizers that add nitrogen, phosphorous, and potassium. The good news is that some farmers do. I read about one such farm in the online magazine [Organic Connections](#). It's called [SEER Center](#): Scotland's Remineralized Oasis. The organization [Remineralize the Earth](#) is also an important resource.

Medicine may have advanced technologically, yet it's not technology that we're lacking. We are lacking basic nutrients and building blocks that power our bodies, power our cells, and give us health. We can eat foods that contain more magnesium, but if it's not in the soil, it's not in the food. Since we don't get enough magnesium from our diet, most people have to rely on magnesium supplements.

WHY MEDICINE IGNORES MAGNESIUM

When asked why doctors don't know more about magnesium and recommend it for all the conditions I talk about, the answer is simple. Doctors primarily learn how to diagnose disease and treat disease symptoms with drugs or surgery.

We don't learn about nutrients in medical school, presumably because drug companies support medical education and patented drugs, not unpatented nutrients. Vested interests have made nutrient supplementation seem unscientific and unnecessary.

Also, as I mentioned earlier, magnesium is its own worst enemy, because it's found in such low concentrations in the blood that it's hard to get an accurate

measurement of total body magnesium. Only one percent of the magnesium in the body is found in the blood. That level is rigorously maintained at the expense of magnesium stores in the muscles and tissues; therefore, most magnesium blood tests will usually be normal. Thus, if you don't look at the clinical picture, dozens of conditions and symptoms related to a simple magnesium deficiency are missed.

Without a "test" to show doctors that magnesium is necessary, the whole topic is shelved, patients' symptoms are shelved, and patients suffer the consequences.

In decades past, in France, magnesium was used effectively to treat infection, polio, epilepsy, alcoholism, prostate inflammation, cancer, and arthritis. Unfortunately, much of this research has been lost or ignored. Present-day use of magnesium in chronic fatigue syndrome, fibromyalgia, detoxification, and anti-aging protocols is also being overlooked. It remains that an educated public is the best defense against magnesium deficiency.

DIFFERENT FORMS OF MAGNESIUM

Most of the questions I get from people are about what kind of magnesium and calcium to take, along with how much to take. I've already stated my magnesium preference above, and it's my own product called ReMag. However, there are many other magnesium products out there so, I'll address the whole topic here.

The Recommended Daily Allowance (RDA) for magnesium is between 350 and 400 mg per day, which is just enough to ward off outright deficiency. However, for optimal health and for the conditions that are triggered by magnesium deficiency, it is perhaps twice as much.

The RDA for calcium is 1200-1500 mg. In the UK and at the WHO (World Health Organization), the RDA is a more realistic 500-700 mg, which most people can obtain from their diets, since calcium is far less volatile and fragile than magnesium.

Most people want to know exactly how much magnesium to take. Please be aware that everyone has their own individual requirements. I'll go into [Magnesium Dosage](#) below, as well as [Detailed ReMag Dosing](#), and information on how to get enough calcium from your diet under [Calcium Dosage](#).

Many people who approach me for consultations or advice have read my [Magnesium Miracle](#) book and realize they are deficient in magnesium. Often, they are already taking magnesium before we talk, but either the form they have chosen is not giving them the results they desire or it's giving the laxative effect. However, when they switch to my ReMag and take it slowly (as directed) they say it's like night and day and even better than IV magnesium.

Therefore, the following list of magnesium supplements begins with the best magnesium, ReMag, but I also briefly list the pros and cons of some others.

I'd also like to say, again, that I'm very much limited by the lack of research on the absorption of minerals. The absorption rates that are given for minerals usually refer to absorption into the blood stream. However, we want to know the cellular absorption, because minerals like magnesium and calcium work at the cellular level. That is another reason why I promote ReMag, because it is 100 percent absorbed at the cellular level.

Best Forms Of Magnesium

In earlier editions of *Invisible Minerals Part I*, I wanted to list all the many forms of magnesium, to be thorough. However, people were confused and just wanted to know the best forms of magnesium to use for their health. They are:

1. ReMag
2. Magnesium citrate
3. Epsom Salts

The forms of magnesium that I do not recommend are:

1. Magnesium oxide, because it's only 4% absorbed and causes diarrhea, which can drain more magnesium.
2. Magnesium aspartate and magnesium glutamate, which Dr. Russell Blaylock says may break down into aspartame or glutamine, two toxic neurotransmitters.

ReMag - Pico-Ionic Magnesium

[ReMag](#) consists of stabilized magnesium ions that are small enough in size that they are fully absorbed at the cellular level. The ionic charge allows ReMag to be attracted to the cells that require it. Because it is fully absorbed, ReMag has no laxative effect.

Joseph B. Marion in his *Anti-Aging Manual* (1999) says, "Most minerals (from food) are 8-12% absorbable, chelated minerals are 40% absorbable, and liquid Angstrom minerals are 99% absorbable, being 7,000 times smaller than red blood cells, 1 million times smaller than a colloidal mineral, smaller than ionic, with negative-charge for added absorption."

Angstrom and Pico-Ionic minerals are similar in size, which means they are 99% absorbed at the cellular level. The difference between angstrom magnesium and ReMag is in concentration. Angstrom minerals are concentrated to 3,000ppm. ReMag is vastly more concentrated to 60,000ppm. Thus, it is 20 times more effective.

Some supplement companies sell colloidal minerals and claim they are fully absorbed. However, colloidal minerals are, by definition, groups of mineral molecules suspended in a liquid held together by their own natural electrical properties. The mineral molecules cluster together, making them into larger particles that may not get through the mineral ion channels easily. Again, we are lacking the science behind these minerals that will tell us the cellular absorption rates. In fact, a mineral's absorption rate usually refers to absorption into the bloodstream, which is what a serum blood test measures. A more accurate test would be an ionized test.

Also, ionic minerals on their own merely have a particular charge, and there is no reference to their size. That's why a Pico-Ionic mineral is the most effective, because it is the right size and has the right charge.

Our Pico-Ionic magnesium, ReMag, contains 300 mg per 5 mls (1 tsp). I personally have very high requirements for magnesium. I take a dosage of 300 mg two or three times daily, pouring the liquid into the 1 tsp measuring cap on the bottle or into a measuring spoon. My body feels much more balanced with 2-3 tsp a day.

Some people may only require 1 tsp of ReMag sipped daily in 1 liter of water to eliminate their symptoms. Everyone is different. That's why I recommend using the [100 Magnesium Deficiency Factors](#) to see the reasons for your magnesium deficiency, and then I suggest you take enough ReMag to eliminate your symptoms.

NOTE: ReMag is 100% absorbed at the cellular level and there is no laxative effect. The magnesium laxative effect specifically refers to forms of magnesium that are not fully absorbed from the GI tract and act like a laxative in the intestines. In some people, IV magnesium, transdermal magnesium, and Epsom salts baths can cause diarrhea or loose stools.

However, even with ReMag, the failsafe of magnesium kicks in once you are saturated. If your symptoms are relieved by 1-3 tsp of magnesium and you take 4 tsp, that extra amount of magnesium is eliminated through the bowels as diarrhea. That's a good thing, because it is magnesium's failsafe to remove magnesium from the body when the cells are saturated and you don't need any more at that time.

Magnesium citrate

Magnesium citrate powder is the most commonly used form of magnesium. Mixed with water, either warm or room temperature, it is better absorbed than in pill or capsule form.

Epsom salts

“The Salts” have been used in baths and foot baths for centuries, popularized by midwives and promoted by grandmothers for relaxing muscles. The magnesium compound is magnesium sulfate, but be wary of cheap forms that may be impure and contain heavy metals. The skin is highly absorptive to good and bad alike.

MAGNESIUM DOSAGE

The RDA for magnesium is about 400 mg of elemental magnesium. However, many people need much more than that. I’m one of them. My main challenge was that most forms of magnesium give me a laxative effect. It got so bad that I was losing weight and nutrients from diarrhea while trying to take enough magnesium.

NOTE: The magnesium RDA for children is as follows. Because ReMag is so well absorbed, you can follow this dosage and add more under a doctor’s supervision.

1-3 years	80 mg/day
4-8 years	130 mg/day
9-13 years	240 mg/day

When I began using angstrom magnesium (at 3,000ppm), I was getting better but I needed 3 ounces per day to treat my symptoms. Then, finally, I had a much more concentrated form made, called ReMag (at 60,000ppm), and I only need to take a few tsp per day to relieve all my magnesium deficiency symptoms, with no laxative effect. Specifically, I needed about 4 tsp for 18 months, and then I was able to lower my dose to 2 tsp a day as my body became saturated with magnesium.

When taking magnesium powders and pills, the average dosage is from 400-800 mg per day of the elemental form. It may seem like a wide range but everyone’s requirements are different. However, by listening to your body, you can gauge your

magnesium deficiency symptoms and take magnesium until they disappear. See the [List of 100 Magnesium Deficiency Factors](#) for more information.

Don't take your magnesium all at once; spreading it out and taking it with meals will slow down transit time through the intestines and enhance absorption.

Some doctors still tell people that they will know if they've had enough magnesium when they get the laxative effect from it, but that's not an accurate way to follow your magnesium intake at all. I know that method does not work for me, and I know it doesn't work for any other people who have slightly sensitive intestines and reach the laxative effect long before the therapeutic effect. I tell people to go by their symptoms to know if they have had enough magnesium. For example, magnesium is effective for insomnia, and magnesium advocates tell people that, if you are taking magnesium for insomnia and you are still not sleeping as well as you want, then take more magnesium. To follow your magnesium saturation, you can take the Magnesium RBC test that you can read about below, under [Magnesium Testing](#). However, since I am a clinician, I still go by a person's symptoms, instead of just depending on a blood test that may be inaccurate due to lab error or taking magnesium too close to having your blood drawn.

DR. DEAN'S COMPLETEMENT FORMULAS PROTOCOL

This book is about ReMag, and although magnesium is the most important nutrient you can take, there are other minerals and nutrients that play a huge role in your health. In this edition of *Invisible Minerals Part I – Magnesium*, I'm happy to put my name to the Completement Formulas Protocol that encompasses those minerals and nutrients that are making health miracles happen.

I find that people do so much better when they take the entire Completement Formulas: ReMag, ReMyte, ReCalcia, ReAline, ReStructure, RnA Drops, and ReNew skin serum. I'm combining the ReMag dosing schedule in with the Completement

Formulas Protocol to give you a better perspective of the complete health program that works for my clients.

In August 2016, we added vanilla-flavored ReStructure to the Completement Formulas. ReStructure is a well-absorbed, high protein powder for athletes and Paleo dieters, as well as a meal replacement for losing weight and balancing blood sugar for everyone. Protein is the main ingredient, but carbs and fats are also a part of the formula, added for the appropriate macronutrient balance. It's also the perfect meal if you are on a yeast elimination diet. ReStructure contains a "secret ingredient": the concentrated, dehydrated RnA Drops, making ReStructure the most unique meal replacement you will ever find. Mix with water, coconut milk, almond milk, or your favorite juice for a delicious healthy beverage charged with the power of RnA Drops!

DETAILED PROTOCOL

While waiting for your Completement Formulas to arrive, begin hydrating your body by increasing your water intake and adding sea salt or Himalayan salt to your drinking water.

1. Water Intake Guidelines: Drink $\frac{1}{2}$ your body weight (in pounds) in ounces of water. If you weigh 150 lbs, you will drink 75 ounces.
2. Sea salt or Himalayan salt: Add $\frac{1}{4}$ - $\frac{1}{2}$ tsp to every quart of drinking water – to one of those bottles, you will later add ReMag and ReMyte.
3. When the products arrive, begin ReAline capsules to assist in detoxing/taking out the trash. Dosage: 1 per day with or without meals for 1 week, then take 1 capsule twice per day.
4. Also, you can begin taking ReStructure as soon as it arrives. Simply shake one scoop of ReStructure in the liquid of your choice and drink to your health. Read the free eBook: *ReStructure: A Completement Formula to ReSet Your Body*.
5. After 4 days of ReAline, add ReMag – Start with $\frac{1}{4}$ tsp per day in a quart of water and sip through the day. Every 2 days, add another $\frac{1}{4}$ tsp. Work up to a

therapeutic dose of 2-3 tsp a day if you are trying to overcome a health condition, if you are on medications, or if you otherwise have severe magnesium deficiency symptoms.

6. After a week of slowly building up ReMag, slowly add ReMyte into the same quart of water and sip through the day. Every 2 days add another ¼ tsp. Work up to 1½ - 2 tsp. The ReMag and ReMyte bottles each contain 8 ounces = 48 tsp.
7. After 2 weeks of ReAline, ReMag, and ReMyte (from day one of ReAline) – add RnA Drops. Dosage: 1 drop, under the tongue, twice a day. Add 1-2 drops every week until you reach 10 drops, twice a day, which is the average dose. Of course, you can begin with RnA Drops alone or add it at any time in your Completement Formulas protocol. However, some people like to do things in sequence.

Note: ReMyte contains 12 minerals, several of which support the thyroid: Iodine, Selenium, Zinc, Molybdenum, Copper, and Magnesium. When you take ReMyte, it can “wake up” your thyroid and improve your metabolism. However, be aware that if you are on thyroid medication, you may find yourself a bit hyperactive, because you no longer need as much thyroid medication as you are taking. Be sure and check with your doctor about reducing your medication. You can read more in my eBook, [*Invisible Minerals Part II – Multiple Minerals*](#), which is all about ReMyte.

Remember: You can follow your magnesium saturation with a blood test that you can order online without a doctor’s prescription. See the section below, called [*Magnesium Testing*](#) for full instructions.

ReMag Spray Facts

1 ml = 8 sprays: 5 mls in a tsp: 1.25 ml in a ¼ tsp = 11 sprays

11 sprays 4 times a day would be a good dosage to start with.

Transdermal magnesium can be as effective as oral magnesium.

ReMag can be sprayed anywhere: face, the arms, legs, belly, and/or back.

Children who refuse ReMag can benefit from ReMag Spray.

ReMag Spray Protocol for injury, pain, and arthritis

Simply pour a few ounces of full strength ReMag into a small spray bottle and spritz on your skin.

Spray ReMag lightly, and don't rub it in, just let it sit and dry.

After a few minutes, spray again, and do that 4-5 times letting the layers build.

Do this 2-3 times a day for painful injuries to help heal deep tissues.

Facial Skin Hydration

Mix full strength ReMag and ReMyte in a spray bottle and spritz it on your face. You will notice the benefits of superior skin hydration.

Detailed ReMag Dosage

If you just want to take ReMag and nothing else in the beginning, here are more detailed instructions. On the ReMag label, the maintenance dose is ½ tsp twice a day. However, many people who gravitate to ReMag are suffering magnesium deficiency conditions and require therapeutic doses, which can be 2-3 tsp per day. Some individuals who used to require several IV magnesium injections per week find they do best on 4-5 tsp of ReMag a day.

I recommend that everyone start slowly when they begin ReMag (or any other drug or nutrient). You may be toxic from taking medications or from yeast overgrowth, so I recommend starting on a very low dose of ReMag. When ReMag enters a cell, it tends to kick out heavy metals and toxins. Therefore, if you immediately start taking large amounts of ReMag, you can experience detox symptoms, or you can wake up your magnesium-deficient body in ways you're not

used to or ready for. Read the section, [When Magnesium Makes Me Worse](#), to understand what is actually happening.

I used to have very specific magnesium deficiency symptoms (heart palpitations and severe Charlie horse, leg cramps), so I use them to gauge my magnesium dosage. When I moved to Maui in June 2008, with all the extra beach-walking, sweating, and swimming, I began to develop leg cramps while snorkeling. I realized I was sweating out and working off more magnesium than in New York, so I upped my intake of ReMag, causing all my symptoms to disappear.

MAGNESIUM TESTING

Magnesium is a very safe supplement. Ask your doctor for a Magnesium RBC blood test to see if you are retaining magnesium, especially if you are on drugs. It's a more accurate test than serum magnesium. You can order your own test, without a doctor's prescription, at [Request A Test](#) for only \$49.00. Aim for an optimum level of 6.0-6.5 mg/dL. The lab range for our magnesium deficient population is 4.2-6.8 mg/dL. NOTE: Do not take or apply any magnesium for at least 12-24 hours before the test, or it will be falsely elevated.

NOTE: Don't be surprised if your Magnesium RBC levels become lower in the first 3-6 months as your body grabs as much magnesium as it can to power 700-800 enzyme processes.

The [ExaTest](#) is an even more accurate test than the Magnesium RBC. Scrapings from under the tongue are sent to a lab, stained with special dyes, and viewed under an electron microscope. Magnesium, calcium, potassium, sodium, chloride, and phosphorus are measured with this test. This test costs several hundred dollars, but it is fully covered by insurance with a doctor's prescription.

The best test is the ionized magnesium test, but it's only available as a research tool. Below is an edited excerpt from my book, *The Magnesium Miracle*, describing this

test. Presently, there are 5,000 blood testing labs in the U.S., and only 140 of them carry out the ionized magnesium test. Most of them are hospital or university research labs. This is a test that we should demand from our doctors, who in turn should demand it from their labs. The following is an excerpt from my *Magnesium Miracle* book:

“Here’s how it works. Magnesium exists in the body either as active magnesium ions bound to nothing or as inactive magnesium complexes (such as magnesium citrate) bound to proteins or other substances. A magnesium ion is an atom that is missing two electrons, which makes it search to attach to something that will replace its missing electrons. Magnesium ions constitute the physiologically active fraction of magnesium in the body; they are not attached to other substances and are free to join in biochemical body processes.”

ReMag is a unique product because it provides the body with a stabilized magnesium ion that can be fully absorbed at the cellular level.

Make sure you ask your doctor to look into the ionized magnesium test. Maybe you live near a university hospital that might have access to magnesium electrodes for ionized magnesium testing.

However, until the ionized magnesium test is available and affordable, use the Magnesium RBC test, and you can also judge how you feel to know if you need more magnesium. I’ve made it easier for you by itemizing [100 Magnesium Deficiency Factors](#) above.

Print out these pages and check off the symptoms that you are experiencing and the conditions that apply to you. Having a dozen of those symptoms or conditions qualifies you as being magnesium deficient.

Then you can perform your own “Oral Clinical Trial”, which simply means, take some magnesium and see how you feel! You’ll be doing a scientific study with yourself as the only subject. After your symptoms improve, stop taking magnesium and see if they come back. If they do, then you have your proof.

Remember, if your symptoms come back, it doesn’t mean you are “addicted to magnesium.” You can’t be “addicted to magnesium.” Magnesium is like food; it’s necessary for the body. In the beginning of treating magnesium-deficiency symptoms, you might need more magnesium. However, as your symptoms improve and your magnesium stores build up, you will actually require less magnesium.

Likewise, if your body has been missing magnesium for years and you begin to take it, you may experience a reawakening of hundreds of enzyme systems in your body that may stir up symptoms. I discuss this occurrence in a blog, called [“When Magnesium Makes Me Worse.”](#) that I’ll excerpt here.

WHEN MAGNESIUM MAKES ME WORSE

When people take a drug or a supplement, they take it with the expectation that it will make them feel better. We know that’s not always the case with drugs, but what about supplements? Because so many people are reading my book and hearing about magnesium, more people are taking magnesium than ever before, and a few people are wondering why it makes them feel worse.

Here’s how one reader put it. “My obvious magnesium deficiency symptoms, cramping, muscle aches, headaches, etc., are worsening slightly rather than getting better. Anxiety is the only thing that has gotten better. Is this normal? I’m using magnesium oil and magnesium citrate but not yet able to tolerate more than 200-300 mg without getting diarrhea.”

I list fourteen main reasons why you might feel worse after taking magnesium, and there may be more. Actually, it's usually not magnesium that's making you worse but just the way you are taking it or other things you are or aren't taking along with it.

1. You're not taking enough: When people feel worse with magnesium, I believe that the 700-800 enzyme systems that require magnesium just get jump-started and They Want More! (I used to write that magnesium was necessary in 325 enzyme systems, but now, according to many and documented by Dr. Andrea Rosenoff, that number is more than twice what we previously thought.)

In the above statement, my blog reader said she couldn't take more than 200-300 mg. However, all 700-800 enzyme systems want a piece of the action once they're been woken up! With each enzyme system pumping away, they are using up the little magnesium you gave them and, like I said, They Want More!

This doesn't mean that you'll increase your magnesium ad infinitum! You will reach a saturation point of your magnesium stores and actually be able to decrease your magnesium intake. However, my blog reader isn't going to get anywhere near the amount she needs if she keeps getting the laxative effect on 200-300 mg. That's one of the main reasons I decided to create and promote Pico-Ionic Magnesium, [ReMag](#). It's absorbed 100% at the cellular level and has no laxative effect so you can take as much as you require to eliminate all your magnesium deficiency symptoms. To determine your magnesium saturation point, get a Magnesium RBC test through Request A Test. The range is usually given as 4.2-6.9 mg/dL; the optimum level is between 6.0-6.5 mg/dL.

2. You're taking too much: You can also feel worse on magnesium if you take too much, too soon. This usually happens if you have fatigue and weakness from magnesium deficiency. Anyone in this category should start very slowly on any new supplement or drug. If you take a high dose of magnesium right from the start, it's

like taking muscles that powered a bicycle and expect them to power a jet. Your body might just be so weak that revving up 800 enzyme systems all at once makes you feel jangled and even anxious because you don't know what's going on. Start with one quarter of the recommended dose of magnesium and work up as your body adapts.

3. You have low blood pressure from long standing magnesium deficiency and adrenal fatigue. You may have heard that magnesium can lower your BP so you worry about that happening when your BP is already low. For magnesium deficiency and adrenal fatigue, you must also begin supplementing sodium as you slowly build up your magnesium dosage. I recommend ¼ tsp of sea salt with every pint of drinking water. The other minerals offered in the multiple mineral, ReMyte, are also important to support the adrenals and thyroid and improve potassium levels.

4. You're on heart medications and as your health conditions improve, your meds are becoming "toxic." That's because you may not require them anymore! Check with your doctor when you are using magnesium to treat health conditions and want to wean off your meds. For example, magnesium helps lower blood pressure. If you continue to take the same amounts of BP meds, your BP might get too low. This is not a "side effect" of magnesium. It's a side effect of taking drugs when you don't need them. Magnesium balances blood pressure. If you have low BP to begin with and are not on meds, start magnesium very slowly because, as I describe in #2, you want your body to slowly adapt to a mineral you may have been deficient in for a long time.

5. You're on fluoridated medications that bind up your magnesium and make you deficient even when you're taking magnesium. See a list of fluoridated medications at the Fluoride Toxicity Research Collaborative.

6. You're taking iodine (in doses above the RDA) that speeds up your metabolism giving you heart palpitations that has nothing to do with magnesium deficiency. However, high dose iodine will cause you to become even more magnesium depleted.

7. You're taking too much Vitamin D: Here's what happens. You feel great on your magnesium and then you begin to experience magnesium deficiency symptoms after adding a high dose Vitamin D supplement. Magnesium is required to transform Vitamin D from its storage form to its active form and for many other aspects of Vitamin D metabolism. That means if you take the extremely high doses that allopathic doctors are now recommending you can plummet into magnesium deficiency and not know what the heck is happening. In general, I don't recommend more than 1,000-2,000 IU of Vitamin D daily for this reason. Also, never take Vitamin D without magnesium.

8. You are taking too much calcium and it's pushing out your magnesium: Read [Why I Hate Calcium](#) to understand why the most prescribed mineral is actually dangerous because it's causing heart disease in women.

9. You're just taking magnesium and becoming dehydrated because you don't take any other trace minerals. Read my blog, [The Solution for Dehydration](#) and take 1/8-1/4 tsp of sea salt in every pint of water you drink. How much water per day? Half your body weight in ounces of water. My new ReMyte, mineral and electrolyte formula is the next step in proper mineral balance and an improvement on just using sea salt for mineral supplementation.

10. Magnesium is getting into your cells and detoxifying chemicals and heavy metals. Sometimes you can have a healing reaction and develop signs and symptoms like skin rashes and itching. That's why with Pico-Ionic magnesium, ReMag, which is 100% absorbed at the cellular level, I recommend that you build up your dosage slowly as the cells detoxify and are finally able to work efficiently.

11. You have IBS or you are very toxic and even ReMag gives you symptoms. IBS is a gut sensitivity of the lining of the gut, specifically the smooth muscles of the gut wall. ReMag goes directly into the cells and will cause the muscles to relax and that can cause diarrhea. Also, ReMag will detox the chemicals and heavy metals from cells and

can cause diarrhea. That's why I try to "warn" people with "health conditions" to go slowly on ReMag for all the 11 reasons I've cited.

12. You're taking a magnesium glutamate or aspartate. I warn against taking these forms of magnesium in my blog [Glutamates in Magnesium Chelates](#).

13. You are taking high doses of magnesium and not getting enough in your diet.

I talk about the need to balance magnesium and calcium by supplementing with about 600 mg of magnesium and getting 600 mg of calcium in your diet. However, many people are on a dairy-free diet and just don't get enough calcium. If it's just lactose intolerance, try yogurt or kefir, make bone broth and non-lactose raw cheese. If you are unable to get enough calcium in your diet, you can take my ReCalcium calcium formula. One tsp equals 300 mg of calcium.

14. You are taking thyroid medication and you suddenly feel you are taking too much (increased pulse, feeling hot, and/or hyperactive). The magnesium in ReMag and the 9 thyroid minerals in ReMyte can "wake up" your thyroid so that it begins to make its own thyroid hormone and you don't require as much (or any) thyroid hormone anymore. (Be sure to check with your doctor and wean off slowly.)

NOTE: If you believe a magnesium product is not working for you or stirring things up or if you are very toxic, take ReMag more slowly. You can put an ounce or two in a small dropper bottle and begin taking 5 drops a day to allow your hypervigilant body to get accustomed to it. Put the drops in a liter of water and sip through the day. That may seem drastic, but 1 drop of ReMag is equivalent to 2.5 mg and even that amount can trigger biochemical reactions. Increase by 5 drops every few days to reach the maintenance amount of ReMag (1 tsp a day) and then the therapeutic amount (2-3 tsp a day).

MAGNESIUM CONTENT OF COMMON FOODS

(Source: The Magnesium Miracle pg 230)

Magnesium in mg per 3.5 oz. (100 g) serving.

Food	Mag	Food	Mag
Kelp	760	Wheat bran	490
Wheat germ	336	Almonds	270
Cashews	267	Molasses	258
Brewer's yeast	231	Buckwheat	229
Brazil nuts	225	Dulse	220
Filberts	184	Pea nuts	175
Millet	162	Wheat grain	160
Pecan nuts	142	English walnuts	131
Rye	115		

CALCIUM DOSAGE

I'm not a big fan of taking calcium supplements that are not fully absorbed, because the excess can precipitate into soft tissues in the body. However, I'll say at the outset that if you do require a calcium supplement, my ReCalcia is the best absorbed and safest calcium you can take. The dosage is 300 mg once or twice a day, depending on how much calcium you are getting in your diet (1 tsp equals 300 mg). My recommendation for calcium intake is 600 mg a day from diet and ReCalcia, not the 1,200-1,500 mg from poorly absorbed forms.

Recent research supports my caution about poorly absorbed calcium supplements. Many studies have shown that women who take calcium supplements suffer a higher incidence of heart disease. Also, the supplements, which are supposed to help build stronger bones don't even do that. The reason for all those side effects with a high intake of calcium is that magnesium is lost from the body and calcium builds up in soft tissues (arteries) and not in our bones!

Often, clients and readers are taking lots of calcium, and, unbeknownst to them, it's driving up their magnesium requirements. We ingest much more calcium in our diet (dairy products and calcium fortified foods) and supplements than we do magnesium, making magnesium "relatively" deficient. What's more is that people don't realize that magnesium helps calcium absorption and helps direct calcium to our bones, so you don't even need as much if you are just taking calcium alone.

There can be a problem of deciding mineral dosage, based on elemental versus the amount listed for the calcium compound. Let me explain. The adult RDA recommendation for calcium is 1,200-1,500 mg of the elemental form. Calcium carbonate has 40 percent elemental calcium and calcium citrate has 20 percent. Therefore, in order to get 1,000 mg of elemental calcium, you would have to take about 2,400 mg of calcium carbonate and 4,800 mg of calcium citrate. Based solely on numbers, calcium carbonate looks like the better choice, but it's basically undigestible chalk.

There is also a problem in deciding how much and what form of calcium to take, because it is so badly absorbed. Unlike magnesium, it doesn't flush out of the body as a loose bowel movement. Instead, it can precipitate and solidify in body tissues and also cause constipation.

Most women I consult with are on maximum doses of calcium and zero magnesium. Their symptoms reflect this imbalance, and they are textbook cases of magnesium deficiency. The more calcium you take, without the balancing effect of magnesium, the more symptoms of magnesium deficiency and calcium excess you have. I'm talking about the osteoporosis that we are being told is a calcium deficiency condition, when it's really a magnesium deficiency. Also, excess calcium intake can result in heel spurs, kidney stones, gall stones, atherosclerosis, fibromyalgia, breast tissue calcification, and calcification of coronary, carotid, and kidney arteries, causing heart disease, stroke risk, and kidney disease.

These are all signs and symptoms of calcium excess that can be overcome with the right balance of magnesium. One customer, after being on ReMag and ReMyte for several months, lowered her blood pressure from 180/95 to 110/60. Also, her ejection fraction improved to 60%, and her last ultrasound of her carotid artery showed a 30% to 40% lessening of calcified occlusions.

A book written by Dr. Robert Thompson and Kathleen Barnes, called *The Calcium Lie*, goes beyond my list of the dangers of taking too much calcium. They make a case for calcium being involved in poor protein digestion, sodium pump failure, weight gain, thyroid and adrenal malfunction, hypothyroidism, and excess problems in pregnancy, childbirth, and menopause.

Also, several recent studies, reported in the *British Medical Journal*, proved that women taking calcium supplements have a higher risk of heart disease.

What's the answer? If we could get all our calcium from plants, that would solve the problem of calcium build-up in the body. Plants have a unique way of only absorbing picometer-sized minerals into their rootlets, chelating minerals with certain proteins, and making them available for direct absorption into our cells. However, the method of attaching a chelating protein to a large-sized mineral, which is what has been adopted by supplement companies, does not enhance absorption more than a few percentage points.

My railing against calcium is mostly because calcium supplements are only about 4 percent absorbed, and many foods are fortified with calcium, and people swallow calcium carbonate antacids like candy, all of which has led to an epidemic of tissue calcification in our society. I don't deny that calcium is vital, so much so that I've been creating a form of calcium that is so well absorbed that you don't have to take large amounts to give your body what it needs. That calcium is in a liquid formula called ReCalcia.

Instead of using inappropriate supplements, and until I created ReCalcia, I used to recommend that people get their calcium from their diet, either dairy products, bone broth, deep green leafy vegetables, nuts, and seeds. However, it's become obvious to me that many people, including myself, don't eat dairy (or don't eat enough dairy) and don't have time to cook bone broth, or we find bone broth too expensive, therefore, we miss out on taking proper amounts of calcium. I created ReCalcia for myself and for anyone else who finds themselves not getting my recommendation of 600mg of calcium per day in their diet.

What is extremely important and unique about ReCalcia is its picometer, stabilized ionic form. This makes ReCalcia 100% absorbed at the cellular level. It will not suffer the same fate as other calcium supplements and cause constipation or build up in your tissues slowly calcifying your vital body organs, including your arteries.

ReCalcia, being fully absorbed at the cellular level, taken along with equal amounts of ReMag, creates the perfect synergistic balance of those two minerals to enhance body function. I'm having good results with the ReCalcia I've been testing on myself for the past several months. As you incorporate ReCalcia into your Completement Formula protocol, please keep track of how you feel and report your findings!

CALCIUM RICH FOODS

in Milligrams

(from *Hormone Balance*-Dean 2005)

Sea Vegetables

Hijiki - 3.5 oz. = 1,400

Wakame - 3.5 oz. = 1,300

Kelp - 3.5 oz. = 1,099

Kombu - 3.5 oz. = 800

Nori - 3.5 oz. = 260

Dairy

Brick cheese - 3.5 oz. = 682

Yogurt - 3.5 oz. = 121

Milk - 3.5 oz. = 119

Fruit

Rhubarb, cooked - ½ cup = 200

Blackstrap molasses - 1 Tbsp = 140

Vegetables and Beans

Dry wheat/barley grass - 3.5 oz = 514

Bok choy - 1 cup = 252

Broccoli stalk - 1 medium = 158

Dandelion greens - ½ cup cooked = 147

Turnip - 1 cup cooked = 126

Broccoli - 1/2 cup cooked = 72

Beet greens - 1/2 cup cooked = 70

Collards - 1/2 cup cooked = 110

Kale - 1/2 cup cooked = 103

Beans, cooked (white, kidney, soy) - 1
cup = 95 to 110

Spinach - 1/2 cup cooked = 88

Baked Goods

Corn muffin - 1 medium = 96

Whole wheat bread - 1 slice = 50

Seafood

Sardines w bones - 3.5 oz. = 443

Oysters - 20 medium = 300

Salmon w/ bones - ½ can (220g) = 284

Almonds - ½ cup = 175

Scallops - 6 = 115

Brazil nuts - ½ cup = 128

Clams - ¾ can = 62

Macadamia - ¼ cup = 119

Nuts and Seeds

Sesame seeds - ½ cup = 76

Hazelnuts - 3.5 oz = 209

MAGNESIUM SUPPLEMENTATION CONTRAINDICATIONS

1. Kidney failure

I make the comment in one of my blogs that hearts don't fail, doctors fail. I think it's the same with kidney failure; doctors have failed to properly educate people on how to take care of their kidneys. Kidney failure is caused by dehydration, lack of proper minerals, treating kidney and bladder infections with strong antibiotics, and not using probiotics. Also, doctors say there are various degrees of kidney failure, but even in mild cases they might tell people to avoid magnesium. Read my article, [Magnesium is Safe and Necessary for Kidney Disease](#), to understand why that is faulty advice. Also, read the section, [ReMag and Dialysis](#) for an amazing testimonial.

2. Bowel obstruction

Magnesium is eliminated from the body through the bowel and bladder when there is excess. Thus, the first two contraindications reflect a person's inability to eliminate magnesium. However, since low potency Pico-Ionic minerals are absorbed at the cellular level, they may not have a negative effect on the kidneys or bowel. This is an important aspect of mineral supplementation that needs to be thoroughly studied.

3. Myasthenia gravis (MG)

IV magnesium could accentuate the muscle relaxation that comes with MG and collapse the respiratory muscles. However, I've received reports from people with MG

who swear that magnesium was helpful in their recovery, especially when their MG was caused by mercury toxicity.

4. Excessively slow heart rate

Slow heart rates can be made even slower, as magnesium relaxes the heart. Slow heart rates are often due to an electrical imbalance in the heart and require an artificial pacemaker.

MAGNESIUM MIRACLE STORIES

I know magnesium works, since it works for me and for my patients, clients, and readers. After taking magnesium supplements, many people have contacted me, describing the reversal of their PMS, painful periods, improvement in symptoms of chronic fatigue and fibromyalgia, depression, anxiety, muscle spasms, and greater enjoyment of sexual activity.

It would be nice to take the top 20 chronic diseases and give you a miracle-healing story about each one of them from my files, but that's not possible. That's not the way the body works. You see, when people have been depleted in magnesium, they develop many different symptoms and conditions, and when they begin to take it for one ailment or another, they quickly find it has an impact on many other areas of their lives.

Let me tell you a few ReMag miracle stories, not about diseases but about people feeling better all over.

Switching from IV Magnesium to ReMag

"Thank you Dr. Carolyn Dean and ReMag! My name is Lynn. My husband, Dana has hypomagnesemia. He is 50 years old and he was diagnosed with malabsorption at the Mayo Clinic. He loses magnesium through his bowels,

therefore oral magnesium was never an option. We have been told by 40 well known specialists that all they could give him was IV magnesium.

Dana had a PICC line for over 7 years and required 4 grams of IV magnesium 3 times per week up until September of 2013. In the past 2 years he has had 3 life threatening events as a direct result of the PICC line (blood infection and on 2 different occasions, blood clots). When the PICC line stopped working the next step was to put in a permanent PORT Line in his chest.

In September the PICC line came out for good as a result of another blood clot. We took a giant leap of faith against all of his doctors' advice and he started on ReMag under the guidance of Dr. Dean. The results were immediate, his magnesium levels are testing higher on ReMag than they did on weekly IV infusions. The best way to take the ReMag is by putting 4 tsp a day along with 1.5 tsp of ReMyte in a designated water bottle that he sips through the day. He also drinks about half his body weight in ounces of water with added sea salt ($\frac{1}{4}$ tsp in every pint).

We are forever grateful to Dr. Carolyn Dean and her commitment to helping others. My husband now has a quality of life he was told was not possible! And we find it quite amazing that ReMag does not affect his bowels and cause a laxative effect like every other oral magnesium he has tried.

We still do weekly labs because we have no room for error with his condition but we know we soon won't need to do them because his blood levels are consistently normal, especially since he began sipping his minerals throughout the day.

We have paid out of pocket for a home health nurse weekly for over 7 years to take care of his PICC line. Our insurance would not cover the expense unless he was homebound and disabled. We have both primary and secondary

insurance however, we still paid a small fortune annually for home health, labs, supplies, medicine etc. But a one-hour consultation and a couple of emails with Dr. Dean forever changed the course of our lives.

The timing of all of this coming together is no coincidence either. Our phone call with Dr. Dean was one week prior to the unexpected issue with the PICC line. Had I not spoken with her on that particular day and things fallen into place like they did, my husband would have a PORT and be sitting in a hospital infusion center 3 times a week. I still can't believe the answer was so simple. I have given Dr. Dean's book to several of his doctors. I wonder how many people are not as lucky as we are?

The PICC line was his lifeline to magnesium however it also almost cost him his life more than once. I refused to believe that was his path and that is how I found Dr. Carolyn Dean. Dr. Dean not only gave him a better quality of life, there is no doubt that she saved his life! As the Holidays approach and I think of the things I am most grateful for, it would be the answer to Prayer and many hours of research - Dr. Carolyn Dean!"

ReMag and Dialysis

The following story I have included in my *Future Health Now!* Online Wellness Program. It illustrates the importance of absorption versus consumption. One client (I'll call her Susan) is a dialysis patient. Her kidneys have failed completely. She requires a machine to clean her blood. She barely urinates.

Dialysis machines, however, are very poor at cleaning out excess minerals. Dialysis patients usually go on a strict diet, where they limit their intake of potassium, sodium, and phosphates to avoid this build-up in their bloodstream. No dietary restrictions, however, are given about magnesium, because there is so little available in our diet, it's difficult to overdose.

Note: If your kidneys function properly, dietary “overdosing” on magnesium is usually not a problem. You will simply urinate it out, or it will be eliminated by having increased bowel movements.

Susan started taking magnesium citrate before she consulted me. She took about 700 mg a day, because she thought she had classic magnesium deficiency symptoms. She quickly began to feel welcome relief once she went on the magnesium citrate. A week later, however, her condition worsened. She started to become very weak, nauseous, sleepless, and suffered horrible headaches. She felt awful.

Her nurse ran a blood test and found that her magnesium levels were dangerously high. (Remember, if your kidneys work fine, this will not happen to you. Magnesium is one of those minerals that will be released by your kidneys and your bowels when there is too much.)

However, Susan wasn’t really taking all that much magnesium—only 700 mg—which is less than she probably needed. When she consulted me, I suspected that her body cells were not absorbing all the magnesium citrate. The rest was left circulating in the blood stream, unable to pass through her kidneys into her bladder. She had already stopped the magnesium citrate and all her symptoms went away in a few days.

We then tried ReMag. This type of magnesium has been broken down to 5 billionth of a meter and would immediately be absorbed into her cells and not build up in the blood. Several days later, she felt much better as her magnesium deficiency symptoms improved, and a week later, her blood work showed that her magnesium levels were fine—no excess build-up.

In Susan’s case, at least, ReMag was absorbed much more completely than the magnesium citrate. The evidence (albeit in this one anecdotal case) is in the blood work and the improvement in Susan’s symptoms.

ReMag and Lung Whiteout

A woman contracted the H1N1 virus. She immediately developed a night-time fever and a dry cough, and within a few days, she was in intensive care on life support. Her chest x-ray showed that her lungs were completely filled with fluid. It's called "whiteout". The fluid was partly from the virus, but mostly from the IV fluids filled with electrolyte minerals that weren't getting into the cells. This is common in human and veterinarian medicine because the size of the minerals keeps them outside the cells. The cells need minerals in order to pull in water. Thus, a person's cells can be dehydrated but have tissue edema, in her case, in the lungs. They didn't expect her to live. Her liver and kidney blood tests showed that they were beginning to fail.

Someone gave her husband the suggestion to rub some ReMag on her feet to make her more comfortable. He massaged a half-teaspoon of magnesium liquid on her feet every hour. The next day, she seemed to be doing better, and they x-rayed her lungs again. The fluid had diminished by 35 percent, and her liver enzymes started stabilizing. On the second day after beginning ReMag, her doctors agreed she was recovering but they warned that it would take two weeks to a month or more before she could breathe without the ventilator. However, on day five after beginning ReMag, she was taken off the ventilator. All her vital signs had leveled out and her lungs were clear, and she was sitting up and taking visitors!

My veterinarian friend, Dr. Wood, was not surprised by this story. He said that he clears pig lung whiteout within hours just by using Pico-Ionic minerals.

Loving ReMag

"I just received my ReMag in the mail and took one dose. A couple of hours later I felt my shoulder muscles (my major stress area) relax and I also felt more energetic. I thought this was impossible, wishful thinking. I phoned customer service to ask and was told it is entirely possible because ReMag enters the cell directly. I am going to love this."

Effects of ReMag

"I have been using ReMag for only five days and I am so impressed with it. I could feel it acting within a couple of hours. I'm more alert, less tense in my muscles, more relaxed, sleeping better, falling asleep faster, waking up less, sleeping sounder. Magnesium taurate made a lot of improvement in my sleeping but this liquid is 10 times better. I am still taking magnesium taurate 625 mg, plus ReMag. My Mom is 89 and she is more alert during the day and sleeping even better at night, not getting up much at night. Dr. Dean, this is the best thing for us. Thank you so much for telling us about it."

ReMag and Arthritis

"I am 68 years old. I was having a great deal of muscle pain and joint discomfort. I began taking pill forms of magnesium and calcium supplements. For the first month I could not handle the calcium but the magnesium helped lessen my discomfort. Then I found out about Pico-Ionic minerals. Still thinking I needed calcium, I took it and my symptoms worsened. Then I just took magnesium and it only took about two months to see a remarkable difference. I now take about two to three times more magnesium than calcium. I realized I had so much calcium built up in my system that when I took more calcium it made me worse. And I believe I'm getting more calcium than magnesium in my diet anyway."

ReMag and Migraines

"I have had bad migraines for a numbers of years but when I began taking ReMag it fully takes them away. Other times it will reduce the migraines so I can function and make it through the day. Every day I take 75 mg and sometimes up to 150 mg. This has become a daily routine for me. It's a lot cheaper than the medication I had been taking."

ReMag: Short Vignettes

- a. "Because ReMag is more concentrated than other liquid minerals, they are less expensive and you end up with more for your money. For someone who hates swallowing pills, it's a godsend."
- b. "We see the results far more than with the capsules we used to use."
- c. "I couldn't believe how much better I felt; it gave me energy almost immediately. No question it has improved the quality of my life."
- d. "I have more energy and feel fantastic! I have tried everything for my chronic fatigue and this is the answer to my prayers!"
- e. "After a few days my energy level was up considerably. My sleep is deeper and I have fewer headaches. Due to a car accident and whiplash, I had pain in my neck for 12 years and now it has improved."
- f. "I am 80 years old and I have suffered from aching muscles and stiff, sore joints for a few years. I just thought it was old age so I didn't bother going to a doctor and was becoming a grouchy old couch potato. Then my son talked me into trying ReMag. Before I knew it, I was bending down and stooping whenever I needed to without grunting. My wife was so impressed she started taking it too and it's helping her."
- g. "Within two weeks of taking this magnesium, I felt a difference in my energy level. In the past I've tried multi-vitamins, exercising and getting enough sleep. But now there is a noticeable difference and I am able to stay up on weekends till midnight. My skin is even glowing and I feel great! I got my mother taking it and her arthritis aches and pains are gone."
- h. "Pico-Ionic minerals give me more energy during the day and it the best night's sleep! How cool is that? I'm in my 40's and was experiencing chronic low energy and disrupted sleep but not anymore."

- i. "Friends told me to try ReMag but I thought their results were too good to be true. But I was pleasantly surprised that I really feel good. I'm on my feet all day at work and by lunch I'm usually tired but now I'm feeling energized all day."
- j. "I'm amazed at how clear my mind is and my niggling aches and pains seem to be diminishing. I'm really impressed."
- k. "As a senior citizen I was becoming resigned to being housebound because it was exhausting and painful to even go out shopping. The Pico-Ionic minerals have made me feel like a new person. I not only shock my friends that I'm out shopping but I recently went to a party where I danced and sang."
- l. "As a professional athlete, Pico-Ionic minerals give me a serious competitive edge; it's really quite amazing."

Magnesium and *The Magnesium Miracle* Testimonials

The remaining stories and testimonials are not exclusively about ReMag. As I mentioned earlier, if you are taking other magnesium products, be sure to add ReMag for the added therapeutic effect.

Magnesium and Jane's Top Ten Improvements

One woman in her early 50's (we'll call her Jane), had innumerable complaints. After three months on magnesium Jane sent me her "top 10" improvements.

1. Less knee pain.

Our knees take the brunt of our weight. The knee is just a simple ball and socket joint that is held in place by the thigh and leg muscles. If those muscles are tight or in spasm, that alone can cause slight displacement of the knee that, over time, can turn into what medicine calls "knee arthritis." However, instead of immediately going on pain medication or undergoing knee surgery to "clean out the joint," magnesium is the treatment of choice.

2. Carbohydrate/sugar cravings down from 90 to 5—on a scale of 100.

Magnesium is a necessary cofactor in the proper metabolism of carbohydrates. It also helps insulin work properly to put sugar inside cells, where it belongs, and not leave it in the bloodstream where it can continue to cause sugar cravings.

3. Facial wrinkles and crevices diminishing.

Jane is a very observant lady and I'm sure others are receiving the benefit of magnesium in this way without noticing. It's likely to do with tissue integrity, hydration, and cell health, all of which are important effects of magnesium balance.

4. Dramatic reduction in migraines.

Migraines can cause the most severe pain known to humans. They are debilitating and said to be incurable. Life-long pain medications seem to be the only option that doctors can offer. However, Jane and thousands of other readers of my *Magnesium Miracle* book have found relief from migraines and headaches with magnesium. In the book, I talk, about also using the herb feverfew and some Vitamin B6 (25 mg twice a day) if magnesium alone doesn't give full relief.

5. Periods went from dark to bright red, from severe clots to minimal.

Magnesium works in several ways in lessening the intensity of menstrual flow. It oxygenates the blood and detoxifies it, changing it from a dark, toxic flow to bright red. It also thins the blood naturally, breaking up clots.

6. Able to exercise intensely for the first time in years.

Prior to this, Jane would be exhausted for at least three days after any exercise.

See the section on [*Magnesium and Muscles*](#) to understand the effect of exercise on magnesium. In Jane's case, it was probably a combination of things. She likely didn't have enough magnesium to neutralize the lactic acid she was building up and,

instead, got aches and pains. Also, one of the first symptoms of magnesium deficiency is fatigue. When you lack ATP, the energy packets that are formed with the help of magnesium just don't have the oomph that you want. For some, exercise gives them energy, but they have to have enough ATP to give them that boost.

7. Sleep has improved from “minimal” to “poor and restless” all night.

When your body is magnesium deficient, it's as if your cells and nerves are all on edge. They are tight, contracted, and ready to snap. If you lie down in that state, your body can't relax, your mind can't relax, and you toss and turn. Simply having your muscles relax with the proper amount of magnesium turns off that tension and allows you to slip into sleep.

8. Able to keep going to some extent past 6:30pm at night.

Without enough magnesium, the necessary energy the body gets from ATP is diminished and people have no staying power.

9. Less sound sensitivity/hypersensitivity.

Studies done in the cockpit on pilots showed an increased sound sensitivity in the face of magnesium deficiency. When I was a guest on a radio talk show, a woman phoned in and asked about her son who was in a rock band. I had been talking about tics and spasms being a sign of magnesium deficiency. She said that her son had developed a tic below one eye and wondered if it could be magnesium deficiency. I said it absolutely could.

10. Better able to concentrate

Jane's concentration would be hampered, especially if there was a lot of background noise.

Poor concentration is not something you will find in a magnesium deficiency list. However, it makes sense that, if your body is tense and irritable and you are sound sensitive, then you can have trouble concentrating.

All in all, the list that Jane provides lends great credibility to the benefits of magnesium. Clinical medicine is based on cases like Jane's, where she is a one-person experiment. Many of my clients have said that they have proven the benefits of magnesium over and over, because when they run out of their supplements, their symptoms return. Someone critical of taking supplements may say that these people are "addicted" to magnesium. My response is that magnesium is a vital nutrient that we can't live without, and unfortunately, because of the lack in our diet and our stressed-out lifestyle, we do have to supplement with this mineral.

Often, it's not until you read something about your specific problem that you put two and two together. For example, many people don't know that choking can be an indication of a muscle spasm in your esophagus. One of the most dramatic magnesium stories I ever heard became a popular post on my blog. See the section: [*Magnesium and Esophageal Spasms.*](#)

Magnesium and Alcohol

Shauna wrote about something she said was "downright weird."

"I like wine, and, gee, almost any kind of alcohol. I cook a lot – garlic, butter, salmon, crab cakes, etc. and [find it] hard to drink a glass of water with good food. If it's Mexican food, I prefer a beer. Some nights as much as a half bottle of wine, but most of the time just a glass or two. And being the type A that I am, and with the muscle tension, I really looked forward to that 5 o'clock hour for that drink to bring me down.

I was pretty sure I wasn't an alcoholic, that it was just a bad habit – one I needed to break. So for the past few weeks I would tell myself that was the week I

would be alcohol free but never stuck to it. In fact, I was getting a little nervous that I could not have that drink!

Enter magnesium. After, I guess, about two weeks on magnesium, I told my husband that this was the week I was going to quit. So out of the past eight nights, I have had only a beer on Valentine's when we went to a barbeque house. Seven night's alcohol free for the first time in four years. So good for me. But the weird thing is, I don't even want a drink, and Saturday night I made homemade pizza and thought I should open a bottle of red wine (which I really love) but I popped a non-alcoholic beer instead, not as many calories as pop, and not as bland as water. The weird thing is that I do not even want a glass of red wine. I'm beginning to think the magnesium has altered my body chemistry to the point where I don't have a taste for it. Either that or my husband had me hypnotized without my knowing it. Have you heard of this phenomenon? Thanks."

As Shauna said herself, she's a type A and was using alcohol to relax her body. When you have magnesium to do the relaxing, you don't need alcohol.

Magnesium and Anxiety

Anxiety is an enormous problem for many people. I address this condition in my *Magnesium Miracle* book, and I receive many emails from people who have managed to overcome their problem and get off addictive medications with the help of magnesium. Veronica wrote about her symptoms and wanted reassurance that they would be eliminated by magnesium.

"I recently purchased *The Magnesium Miracle* and must begin by telling you that this book has begun to answer some questions about my health. My symptoms have included stress, anxiousness, sweating, mild depression, and spasms all over the body, often during the course of the day. I was diagnosed

as a child with IBS, and the associated symptoms have only increased as I passed into adulthood. I have been to several doctors who have told me that the problem is not a physical one (I have had a colonoscopy, which was clear).

Nonetheless, the symptoms cause me great difficulty, making it very difficult for me to work, or to interact socially comfortably. In reading your book I have noticed that all of these symptoms are related to the lack of magnesium.”

Magnesium and Arrhythmia

Nancy wrote a very long story to me, some of which I’ll include here, to highlight the use of magnesium in abnormal heart rhythm.

“Dr. Abram Hoffer told me about your to-be-published book last fall. I could hardly wait for your book to come out.

A year ago my cardiologist had me wear a Holter for 24 hours to determine what kinds of arrhythmia I had. I had been taking more potassium and B6, which seemed to relieve the arrhythmia. Then I began to suspect that I might be losing potassium—that maybe I was losing it almost as fast as I was taking it. So a nutritional MD ordered a 24-hour urine test to check excreted minerals, and [found] I was passing large amounts of magnesium, potassium and lithium. While the larger amounts of magnesium and potassium could have come from my supplements, I was not taking any form of lithium.

To look into it further, I had a White Blood Cell test for magnesium and a Red Blood Cell test for potassium. I was low in magnesium, not potassium! And, as my doctor pointed out, magnesium is needed for metabolizing potassium.

The moment your book was available, I picked up a copy and read it as well as an article by you in the *Natural Health* magazine, in which you wrote about your water fast in the morning. I began making changes—too numerous to list

here—and with those changes I noticed a sudden increase in energy, verified by counting my RPMs on our reclining exercycle while recording my pulse and pedaling at the same resistance.

This week my cardiologist ran a treadmill test and said he could find no abnormalities in my heart rhythm! In fact, just a couple of weeks ago after I gave him copies of pages from your book focusing on arrhythmias, he ordered a copy of your book and plans to include information from it in a lecture he will be giving.”

Magnesium and Asthma

I have many stories about magnesium and asthma. I'll include three here to give you an idea of the miraculous power of this mineral.

a. Charles wrote about a relative who probably needs more magnesium.

“A relative of mine (lady in her 70's) suffered from asthma all her life. Had to have the ambulance on a number of occasions. Now diagnosed with COPD (chronic obstructive pulmonary disease). She had tinnitus about twice a week too. I got her to take 150 mg of Magnesium Citrate every day. Her breathing has greatly improved and her tinnitus has now completely gone.

I take 400 mg per day. No more laryngospasms and no more leg cramps. My wife takes 200 mg, no more cramps and no more insomnia!

I know a number of people, including my wife and myself, who eat a well-balanced diet of fruit/vegetables/fish/meat etc. If food contained all that our bodies required, we would not need to take magnesium supplements to cure our spasms/tinnitus/cramps/breathing.”

b. Violet writes a very instructive testimonial about her husband's magnesium treatment for several chronic conditions. They mostly use

magnesium oxide, which I don't recommend because of the strong laxative effect. However, it obviously seems to be working for them. I told Violet to continue the magnesium oxide, but add ReMag to get more magnesium into their cells, and cut back on magnesium oxide if there are more than two bowel movements a day, so they don't lose valuable nutrients.

"My 62-year-old husband is a severe asthmatic ... or rather he WAS, until he found out about magnesium. We take pure powdered magnesium oxide and sometimes magnesium chloride in water. The first tastes better.

Before that, two years ago, our medical doctor told him he was in danger of dying from 1) asthma, 2) heart attack and 3) high blood pressure. The doctor prescribed blood pressure and asthma meds.

He had leg cramps that night that woke him up. He prayed and asked the Lord why. He heard the words, "low magnesium". We studied this on the Internet, bought your book and before it arrived started taking magnesium oxide.

He also took apple cider vinegar (ACV), at least a dessertspoon full, with crushed garlic and thyme added every day, drank 10 10-ounce glasses of water a day with ¼ tsp of sea salt with every four glasses. We also eat lots of cayenne pepper (a vasodilator) and take homemade Haw sauce daily. Haw sauce is also a vasodilator and strengthens the heart.

In 10 days his blood pressure dropped so low he was having fainting spells. He called the doctor who shouted, "Stop taking the blood pressure meds!" Now he takes no blood pressure meds at all and is off all meds except one for asthma prevention, Flixotide. His health has changed so dramatically for the better the doctor has changed his attitude about natural health.

If there is an asthma attack, which is very rare these days, he can stop it within minutes by taking two glasses of water and a ¼ tsp of sea salt and a ¼ tsp of magnesium oxide as well as Ester C and calcium. The only time he has relapses is when he doesn't take enough magnesium in a day.

His condition may have started because we used to drink six to eight mugs of coffee a day and hardly any water. [Dr. Batmanghelidj](#) said that asthma starts as a dehydration disease, coffee is a diuretic, and taking water and sea salt corrects the condition. We add that magnesium deficiency is a major contributor to asthma.

Medical doctors err by prescribing drugs that further dehydrate the patient, like diuretics for blood pressure! Magnesium relaxes the lungs, improves air flow and dissolves the calcium that is laid down in the soft tissues when you are magnesium deficient. Magnesium balances calcium.

We have a friend who had severe gout over many years. We suggested some of the above and gave him a bottle of magnesium. He called 18 hours later to say 'Thank You' because his symptoms had disappeared completely.

Also I gave magnesium to my neutered cat that suffers with Feline Urinary Syndrome (FUS), which are crystals in the urinary tract. He was cured permanently in three days. I keep magnesium oxide in a saltshaker now and put it over the dog and cat food. It also calms down horses, including our thoroughbreds, which are supposed to be flighty but aren't really. It's just magnesium deficiency."

c. Here's another asthma story that I highlighted in one of my blog posts. It's from Bill, an asthma sufferer, in Florida. The "boys" he refers to are two new kittens he adopted recently.

"I was having so much allergy/asthma trouble; I was sure I would have to give these boys back to the shelter. That was making me sad.

Since beginning the magnesium supplements, I have had very little trouble. A bit sniffley some days, but no asthma troubles at all. Among the worst things that happen when you experience allergic symptoms that develop into an asthma attack is the anticipation—moment to moment—of what will happen with the next breath. For me, my lungs can close up in a matter of a few breaths. Very scary stuff. It gets to where your entire existence is all about each breath, literally. Nothing else matters then. And my lungs can close up in a matter of a few breaths.

I am happy to say I won't have to deal with that anymore and I will be able to keep these kittens! This is making me very happy! Thanks so much for the suggestion. I can't believe this is real. I need to do something to make other asthmatics aware of this. It is amazing!"

The reason magnesium helped Bill was most likely, because it relaxed the muscles in his bronchial tract, causing them to not close down.

Magnesium and Back Spasms

I've received many stories about the relief from back pain or spasms that people get from taking magnesium, either in Epsom salts baths or from oral magnesium. I'll highlight Sarah, who wanted to share her magnesium miracle story, which reads like another top 10.

"A year-and-a-half ago I had a back spasm that wouldn't quit. Three chiropractic adjustments and a massage would not make it let go, so the chiropractor gave me some magnesium citrate powder to take. Fifteen minutes after taking a teaspoon of the powder, the spasm started to relax. I immediately went to the Internet to do some research on magnesium

deficiency and I “bumped” into myself. All the little cramps, the eye tic, the mitral valve prolapse, the high blood pressure, the pre-eclampsia of pregnancy, and the PMS seemed to be related to one thing—a need for magnesium. Also, I realized I was over-dosing on calcium, which exacerbated the magnesium deficiency.

Supplementation has made such a difference in my life that I only wish I had known about it 25 years earlier when my child was born. Then in August your book came out and I was amazed all over again. Nobody believes that such a simple thing has such far-reaching implications. However, a friend who is a competitive long-distance runner has gotten relief from her migraine headaches after I told her about magnesium.

Thank you for your informative book. It explained so much. Truly a miracle.”

Magnesium and Blepharospasm

A woman dentist from Mexico actually had 20 symptoms that have improved with magnesium, but the most dramatic is her “incurable” eye blinking.

“Hello Dr. Dean. I'm a Mexican dentist, 42 years old. In June 2002, I started feeling “sand” in my eyes and went to an ophthalmologist whose diagnosis was “allergic dermatconjunctivitis” and [was] prescribed some ointments and drops for my eyes. They didn't work so I went to see another four ophthalmologists and they changed the diagnosis to “keratitis”. In the meantime I started to develop eye blinking that got worse and worse until it became a severe spasm that I couldn't open my eyes. I also started having tetany. From the first doctor until this point, two months had passed. Needless to say that I was desperate and very depressed. I couldn't work, drive or even walk! Then I went to see a neuro-ophthalmologist who gave me the terrible diagnosis of essential blepharospasm: “essential”, because this means that

they don't know what causes it and of course there is no cure. He also told me that this was known as "Meige Syndrome" and he offered me three options:

To take neurological prescriptions (sedatives for life) that had to be changed every three months because they lose their effect.

Botox injections, with the risk that the eyelid could drop.

A facial nerve blockage (the motor part) in my face (it's a horrible treatment where they give you shots all around the forehead and eyelids with an alcohol-derived substance; the injections goes to the depth of the bone.)

He recommended that I try number 3 first, so I accepted the treatment. This was in August 2002. Let me tell you that it was a HORRIBLE experience. My face was swollen at least five times the normal size and he definitively did something wrong because he left me with facial paralysis on the left side. So, my right eye couldn't close and my left eye was still closed because it didn't respond to the shots. He prescribed me cortisone and told me that we had to wait and see what happened. I was feeling miserable.

And then, the miracle happened: I needed something to be fixed in my kitchen so the person who came to do the job brought this book about magnesium and it caught my attention because I had started to take a calcium/magnesium supplement because someone told me that it was very good for stress. By this time I couldn't read because the eye drops I was using caused mydriasis (excessively dilated pupils). I asked him to lend me the book so I could make a copy to read it later.

The next day he arrived with my copy, and since I could do absolutely nothing else, I made a huge effort and started to read the book, line by line. As I got further and further, I realized that almost everything that I was reading was

about the health problems I've had my whole life, so I started to take magnesium.

I got magnesium chloride in drops, I started to take it in November 2002 and began to improve week by week. Four weeks later the paralysis was gone and the blepharospasm was improving beautifully. Then I started research on the Internet (that's where I knew about your book). In December, I went to US and bought magnesium glycinate and started taking 600 mg per day in three doses. And besides the blepharospasm and paralysis these are all my other symptoms that are diminishing day by day:

- Blepharospasm
- Paralysis
- Chronic fatigue syndrome
- PMS syndrome
- Excessive emotional stress
- Joint pain
- Back and neck pain
- Constipation
- Anxiety
- Nervousness
- Arrhythmia
- Cystitis
- Colitis
- Bad circulation
- Cold hands and feet
- Feeling disoriented in space and time
- Depression without apparent cause and unable to cope with everyday things
- Flatulence
- Mood swings
- Hormonal imbalance

They are not all 100 percent gone but almost!!!!!!! The 'incurable blepharospasm' has almost disappeared and I feel that it will very soon be

gone completely. I wanted you to know my story because if someone has had the same diagnosis, I want them to know that there is hope that IS CURABLE with the Miracle of Magnesium. Thank you very much!!!"

Magnesium and Esophageal Spasms

This was a story that I sent out in my blog with the title, "A Magnesium Miracle: Man Saved from Gagging."

"The moment the waiter served the meal, Jeff jumped up from the table and ran for the restaurant's emergency exit. Jeff could feel the little bit of appetizer he'd eaten backing up into his throat causing tremendous pressure. Jeff's brother, Chris, quickly followed him into the back alley. Lucy, Jeff's wife, explained to the other guests that her husband had a long-standing problem with his gastroesophageal junction (a ring of tissue where the esophagus meets the stomach) clamping shut. 'Usually he can feel it coming on and drink some water and it goes away,' she explained.

Chris found his brother outside vomiting. Jeff couldn't even swallow his own saliva. 'Go back in and finish your dinner,' Jeff said, 'I'll be okay.' Chris went back inside. When Jeff didn't return, Lucy went out to the back alley. She found Jeff choking. 'Do you want to go to the hospital?' she asked. 'No,' he gagged.

Lucy gave him water. He just choked it back up. She started massaging his chest. When that didn't work she began pounding and pushing his chest against handrails. They even tried handstands. (I don't recommend any of these 'treatments!' ~Carolyn) Nothing helped. The spasm wouldn't relax. That's when Lucy suddenly remembered: *My sister swears magnesium has helped so many times whenever there was a weird body problem.* 'Magnesium might work,' Lucy told her friends, 'too bad we don't have any.' The magnesium angels,

however, were with Jeff that day – one of Lucy's friends remembered she had some magnesium citrate powder packets in the trunk of her car.

Lucy grabbed the magnesium, added water, and made a super-concentrated serving. She went out and found Jeff gagging on his spit.

'Hold this in your mouth,' Lucy said. 'Don't try to swallow it.' Jeff sipped a mouthful holding the drink in his mouth. About a minute later his face relaxed. Spitting it out, he said, 'I want to try swallowing some.' 'It's pretty concentrated,' Lucy warned. Jeff took the glass and swallowed a gulp. In two minutes he smiled and walked back into the restaurant to finish his meal.'

The moral of this story is that any muscle or nerve problem can be caused or worsened by a magnesium deficiency. I asked my readers to give me their explanation of what happened to Jeff and I received some very good answers.

One of the most in-depth answer was:

"Magnesium relaxes the involuntary muscles including the bowel (which is why overdosing causes diarrhea) and magnesium deficiency could block the esophagus. Holding magnesium in the mouth will cause it to be absorbed sublingually. Magnesium chloride would be absorbed faster, but tastes bad. Magnesium oxide will work in water and is tasteless. Further, sheep farmers give sheep magnesium blocks. Animals that are magnesium deficient become aggressive and hard to handle, just like over-active kids. Kids should have magnesium, not Ritalin. Racehorses get a shaking disease if they are deficient in magnesium. The answer is to add magnesium, not meds."

One gentleman wrote about magnesium/calcium physiology: "Magnesium is a muscle relaxant and calcium is a muscle contractor, this is very important to a normal heartbeat. All heartbeat irregularities start with a magnesium deficiency. Magnesium

is the ion responsible for muscle relaxation. When calcium gets into empty magnesium channels, you get a contract (calcium) / contract (calcium) signal instead of a contract (calcium) / relax (magnesium) signal. If there is a deficiency of magnesium any muscle could contract and magnesium will relax it as the body comes back into a balanced state. This is why Jeff's esophagus relaxed after the magnesium treatment."

Another reader said, "I would guess that Jeff was also having anxiety about the situation—the magnesium also calmed his nerves."

A reader took the opportunity to share her story about esophageal spasms.

"I am very interested in this article. I have had similar experiences (have probably left hundreds of tables) over the years. My remedy was always to drink gallons of water to force food down. I would have loved to have known about this—instead I had some major surgery, which has caused other problems, for which I refuse to take medication. I think the magnesium probably relaxes the muscles in the throat. I discovered magnesium for my restless legs and have never had a problem with my throat or legs since. Thank you—am looking forward to reading your book on "magnesium"—I do think it is a miracle!"

Most fascinating Jeff's story was how fast he saw results simply from holding the magnesium drink in his mouth. When your body needs something, it knows what to do with it once you provide it. Magnesium must have been absorbed through his tongue and the interior of his mouth. His bloodstream transported the desperately needed mineral straight down to his esophagus. Once absorbed into the muscle cells, the gastro-esophageal junction could relax.

Magnesium and the Elderly

Here is a short burst of excitement from one of my blog readers.

"My 89-year-old mother and I, every day, are taking 1375 mg of magnesium; 650 mg magnesium taurate and 750 mg ReMag. Our sleep is fantastic, we have no more cramps, good bowels, no wheezing, more relaxed and because of all that we are much happier!"

Another reader had the following experience with her mother.

"As a retired Registered Nurse, I have always appreciated your writings. The life-saving advice regarding magnesium is priceless. My mother had suffered for years with COLD, hurting legs. I had a battle ROYAL with the nursing home physician, but FINALLY convinced her to TRY magnesium taurate. It not only stopped the leg cramping, it lessened the heart arrhythmias. I believe it lengthened her life."

I call this wonderful email "The Zest for Life". This gentleman writes to me like a long-lost friend exuding confidence and energy that is palpable. He praises magnesium as a major factor in his "new way of living".

"I loved your informative article! You are a godsend! Fortunately, I've been using magnesium for a few months now, and I've benefited immensely.

Unexpectedly, my toxic peripheral neuropathy is almost completely gone. I no longer need to take ALA and acetyl L-carnitine at all.

My irregular heartbeat is no longer pounding like a Swiss watch.

My lower back and joint pains are gone, and I can work out in the fitness center to my heart's delight, despite being 67 years old.

Even my eyesight has sharpened.

I do focus on my bone health by balancing my alkalinity levels (with diet and bicarbonate of soda) to maintain 7.5 more or less. (Checking with litmus paper.)

I take calcium and other minerals in early morning, and strontium citrate before bed. I imagine strontium and magnesium are synergistic. If I had my druthers, I'd take strontium over calcium.

I stick to what I call my "caveman diet", avoiding sugar, dairy, and wheat, especially baked goods. I also avoid restaurant foods because of soy-derived chemicals, among other things, and prefer a simple diet cooked from scratch.

My exercise program includes 50 miles of mountain bike riding and I've had a resting heart rate of 45 for a couple of years. Actually, my cardiologist insisted I might have some hidden heart problems, and talked me into another nuclear stress test last February.

My health was nearly flawless before the test, but it took me eight months to recover from a return to heart rhythm irregularity, painful joints and lower back pains. It was so bad I quit working out at the fitness center, though my muscles were unaffected and remained strong. I couldn't have muscular strength adding stress to my painful joints.

With my rather simplified health program, I was surprised to find that my body's natural alkalinizing processes have kicked back in, and I rarely check my alkalinity levels with the litmus paper. I also have been skipping the baking soda supplementation since now I'm feeling "as fit as a fiddle!"

Despite the disconcerting nuclear stress test setback, I've come through it a better man since I found it necessary to uncover health breakthroughs in order to meet the challenge.

Now I call my approach my “new way of living” program. People are always asking me how I’ve done it, but when I tell them, I sense that they’re predestined to remain entrenched in their old ways.

Like the old saying goes, “you can lead a horse to water, but you can’t make ‘em drink”. Nonetheless, I still continue to champion magnesium, strontium, alkaline balance, exercise, and a simple diet prepared from scratch.

Love ya.”

Magnesium and Heart Palpitations

“I have just purchased your book and cannot wait to read it. For months I had foot and toe cramps, anxiety, my body was nervous and tense. (My doctor commented on how “wired” I was.) I wanted to unzip my skin and jump out. I thought it was my age of 52. I then developed PVC heart palpitations and was told to live with them. Finally, I hit a wall and could not sleep! I found magnesium citrate powder and have been on it for two weeks. The heart palpitations went first, then the foot cramps. I still have night-time awakenings but it is getting better. I take the magnesium three times a day for a total of four teaspoons. I just ordered the magnesium oil. I forgot to mention I was under intense stress for three months. I think I really depleted any magnesium I had in reserve!”

Magnesium and Kidney Stones

George emailed the following story about his painful bout with kidney stones.

“Last Fall, I was passing stones almost on a daily basis. All the usual recommendations did not help. In desperation, I bought your book about magnesium because it had some information about kidney stones. I started taking 250 mg of magnesium and 50 mg of B6 daily. The stones stopped the

day after I started taking magnesium and B6. The last stones I passed were on 10/31/06. Since then, no more stones have passed. I am hoping that this amazing health improvement continues. Keep up the good work."

Kevin emailed me about his experience with kidney stones.

"About 20 years ago, I passed a kidney stone which stuck in the urethra halfway between the kidney and the bladder. The consultant recommended plenty to drink. No movement of the stone. He then suggested an operation to remove the stone. At this time, I had a book, "Let's Get Well" by the American nutritionist, Adele Davis, in which she had a chapter entitled, "How to dissolve kidney stones" in which she recommended magnesium and vitamin B6.

I wrote to the consultant to see what his reaction was, which was to call the treatment positively dangerous and I should come in for an operation immediately. I ignored his advice, and started on the magnesium and B6. Three weeks later, whilst urinating, I passed a spherical kidney stone. I made an appointment to see the consultant, and presented him with the stone. There was no comment, except a "stony" silence. He was not happy.

I expect he was thinking that it was not in his interest to follow that course of treatment with his patients, as he would soon be out of a job.

Since then, I have recommended magnesium and Vitamin B6 to people who have had kidney stones, but they seem very dubious about the treatment, and only want to have orthodox medical treatments.

I notice that there is a lot more publicity now to the alternative treatment, and, hopefully, people will listen."

Magnesium and Carpal Tunnel

At one point a friend said he wondered if I was writing too many magnesium stories in my blog. Many readers probably found my blog through my magnesium book. He thought they must be saturated with magnesium information. However, when I ran the numbers, I found that every time I blogged about magnesium, readership went up 30-50 percent with people forwarding the post to friends and family.

I told him, it's like watching ads for something you already own—it reinforces how smart you are to have purchased that product, but even then, it doesn't mean you take the advice.

A short while later, he said in passing, "My left wrist is really hurting. Too much work on the keyboard, I guess." "Don't forget to put magnesium oil on it," I automatically replied. "It'll help stop the muscles from cramping." "I hadn't even thought of that," he said. "I guess you still need more magnesium stories after all."

Even though you may know enough about magnesium to write your own book, are you using it for all possible magnesium-deficient conditions and symptoms? Are you using the best absorbed and more therapeutic form of magnesium – ReMag?

Magnesium and Chest Pain

Nell wrote about her husband's chest pain experience.

"I am writing to you today because I have just finished reading your very informative new book, *The Magnesium Miracle*. One month ago, my husband was having all of the symptoms of a heart attack. He had chest pain, arm pain, jaw pain, was sweating and could hardly take a breath. He was rushed to hospital and they immediately started doing tests on him. They kept him for two days and could find nothing wrong with him other than a small lesion on one of his heart vessels after performing a catheter. But they said it was nothing to worry about. They released him while he was still having chest pain

and told him to take an aspirin a day and also to continue his blood pressure medicine.

Needless to say, I was not satisfied with this whole situation (What if he had another attack?), and I started to do my own research on the Internet. I knew that magnesium was a relaxant for muscle spasms and so I started looking at the benefits of magnesium and the heart. I then came upon your book and ordered it and was so pleased with it being the wealth of information that it is.

I started my husband on a chelated calcium/magnesium supplement and within a few days, he was no longer having spasms. He also told this to his family doctor and his doctor agreed that a lack of magnesium was most likely indeed the problem. Now with all of the technology and other tests that they did on my husband, why could they have not ordered a simple ion magnesium test? Why did they send him home without this simple test? I think that every doctor in America needs to read your book and become educated on the miracles of this vital mineral. It could benefit so many people!

I would also like to add that we do eat a very healthy diet with a lot of raw fruits and veggies and brown rice etc, but I believe that we also do need to take supplements because our soils are so depleted here. Thank you for writing this book and I hope that your email box becomes flooded with other success stories! In good health."

Magnesium and Diabetes

Harriet wrote about her discovery of magnesium for her symptoms.

"Dear Dr. Dean, I have been taking calcium, magnesium and zinc in combination for years with time off for bad behavior. I rediscovered this miracle when I was diagnosed with diabetes. I'm 62 and have been diabetic for approximately seven years. When the neuropathy hit my feet I was reading

Maureen Salaman's book, *All Your Health Questions Answered* and noticed that magnesium was mentioned as beneficial in almost all of the chapters, even though she does not have a chapter on neuropathy. It was quite obvious that magnesium is a mineral for all nerve-related problems. While doing some research on vitamins and minerals, I came across your *Magnesium Miracle* book and immediately bought a copy. It is fascinating. I first became interested in vitamins in the 70's when I read Linda Clark's book, *Know Your Nutrition*, so I'm not new to the subject.

The calcium, magnesium and zinc combination has greatly helped my neuropathy. And without it, I wouldn't be able to sleep. Neuropathy gets so much worse when I lay down. I have been on the Neuropathy Association message boards touting its benefits. I am a believer, believe me."

Magnesium and Laryngospasms

This story follows along the lines of Jeff's esophageal spasms. Laryngospasms occur higher up in the chest.

"I have read your website and you may find my story interesting. About four years ago I suffered three laryngospasms within about 12 months. The last two were within six weeks of each other. I was then referred to the hospital clinic. A doctor there said my laryngospasms could be caused by my goiter and the only advice given was to breathe in slowly during an attack. Not a cure.

I quickly found on the Internet that calcium deficiency can cause muscle spasms so I asked my doctor to check my calcium level. It was okay but as a precaution, I started to take calcium anyway—taking just ½ of the RDA (400 mg).

Very, very fortunately for me, the supplement I bought, in addition to calcium and vitamin D, also contained magnesium, copper, boron and zinc. I had no

further attacks for nearly three years. But after about 2½ years I began to purchase most of my supplements in supermarkets. The one I found contained calcium and vitamin D but no magnesium. Approximately four months after using mostly that supermarket supplement, I had three very slight, short attacks within about a four-week period. Foolishly, I ignored them. Five days after that third attack I had a full frightening laryngospasm. Immediately I returned to taking my original supplement and finally realized it contained magnesium.

I have not suffered any further laryngospasms. The RDA for magnesium for the older man is about 400 mg. I'm finding that foods containing the most magnesium are not those eaten every day, if at all, by most people. (Halibut, Almonds, Soybeans, Spinach) So to absorb 400 mg RDA may be quite a task for me to achieve, being 75 years of age.

Magnesium deficiency can cause muscle spasms and cramps etc. Although I may not be deficient, I believe that my voice box muscles are being kept relaxed simply by taking ½ the RDA and this prevents laryngospasms. Also an occasional early morning leg cramp seems to have abated since taking magnesium.

I have started to write to ENT specialists etc, found on the Internet, trying to get them to consider magnesium when patients present to them. So far I haven't had any replies, except from Dr. Dean, of course!

BUT, I wrote to my own doctor and he found my magnesium cure, "interesting" and would consider this when his patients present with muscle cramp problems. So I have made a tiny, tiny start to get the magnesium message over.

Every time I meet someone now, I ask if they suffer from either leg/muscle cramps of any kind or tinnitus. I do get odd looks, but if they do suffer, I tell 'em what to get!"

Magnesium and Healthy Nails

Joan is taking very low dose magnesium supplementation, but, even at a low dose she still finds that it's helping her in interesting ways.

"Thank you Dr, Dean for all of your information. I began taking more magnesium after reading that it may help Fibromyalgia. I am not sure that I have that actually but with Type 1 Diabetes for 40 years, I do have stiffness that I thought might be remedied somewhat by it. I take 300 mg of magnesium and a chewable calcium. An unexpected outcome: my nails are growing like wildfire! They have been brittle for years and I am sure it is from the magnesium. I think I can safely assume that my internal organs are benefitting also. Thank you for the confirmation and for your excellent work and vigilance!"

Magnesium and Insomnia

"I have been reading from your book *The Magnesium Miracle*. For years I have been troubled with insomnia. I have absolutely no sleep in me at night and I can't sleep even during the day. I have tried lots of home remedies like melatonin, valerian, all the B vitamins, tryptophan, calming teas, all to no avail. I've done exercise and read a lot about relaxing and did it all. I had been on sleeping pills to get maybe three to four hours sleep at night. But they have had side effects that made me nervous.

So I stopped the Ambien (and at one time was on Lunesta) the first of February 2009. I have been taking a multi-mineral formula with boron since the middle of February 2009. This has 1,000 mg of calcium and 500 mg of magnesium,

plus iron and other things. I'm already able to sleep at night. Every night is getting better. Now, about four days after I started taking 600 mg. of magnesium a day I really am enjoying "sleep". It is so wonderful to just fall asleep. I still wake up every two hours or so, but I can fall back to sleep again. Before magnesium, I hadn't been sleeping without the aid of Ambien. Thank you for the good news about magnesium. Wish I had read your book sooner."

Magnesium and Neck Pain

Sophie got a new lease on life when she discovered magnesium.

"I started feeling different two days ago when I noticed the pain in my neck was gone. This had to be a miracle. I was buying everything for neck pain and nothing was working. I didn't know magnesium would help this problem but I was just trying it to help my high blood pressure. I have started using magnesium oil and ordered magnesium supplements. I got up with so much energy, I thought something was wrong. I feel young again and very different, very calm, nothing bothers me. I'm sleeping better. This is so amazing. I'm going online and ordering your book for my friends with high blood pressure.

I don't see how this is not on *Oprah* or mainstream TV. I feel like I have been handed a new life. I can't wait until spring with all this energy and see what I get done. And I've discovered something else that is blowing my mind. We go out to eat every Saturday night with family. This time I noticed that all they were saying was how tired they were and I felt like a million dollars. I almost felt like I was with the wrong group. I'm 61 and my husband is 65, and they are two and three years older than us.

I watched them and they walked slow and ate slow. I have also noticed I am not as hungry but the thing is in my mind—I'm sitting in this restaurant and I am so happy and loving everybody and just want to talk to everyone. Other

times I just want them to give me my food and leave me alone. But last night I was actually laughing with the waitress and other people at the restaurant. I feel so different. How can this be from one thing, magnesium?

My husband said, "Give me some of that stuff you are taking"; he could see a difference in me. I am so happy and feel so good, so I spray him with the oil when he gets out of the shower and put the gel on his feet and then give him the magnesium supplement. Thank you so much for your work and your book."

Magnesium and Orgasm

One amazing story was sent to me since the release of *The Magnesium Miracle*. A woman says it's helped her overly active gag reflex, insomnia, irritability, and chronic muscle aches, which magically disappeared. She says it's also responsible for her being able to reach orgasm! After the fourth time, she was convinced it had to be the magnesium. This could be true, because magnesium is a natural muscle relaxant!

Magnesium and TMJ

"I discovered magnesium two weeks ago and there is a benefit that you may not have even discovered. I had severe TMJ (tempromandibular joint syndrome) and it seemed to spread to my whole body and I ached all over. I was miserable. I was on Paxil to keep my sanity but I wanted to lose weight and I pulled out my college nutrition textbook, *Introductory Nutrition*, Guthrie, Pennsylvania State, 1971. This book devoted more than three pages of fine print to the need for magnesium. Here are some of the things Guthrie published about magnesium in 1971.

— 'Low serum magnesium levels are associated with irritability, nervousness
- adequate magnesium may increase the stability of calcium in tooth enamel

- alcohol increases the rate of magnesium excretion
- the absence of magnesium deficiency symptoms in the American population, which apparently consumes too little to meet its needs, may be explained by the fact that it experiences a very slight deficit that becomes significant only when a condition of stress is superimposed. Such situations may be the increased excretion that occurs with alcohol consumption, the impaired absorption accompanying the increased use of diuretics.”

My TMJ writer continued.

“I am skeptical of diet books, but I am not skeptical of university research. I immediately went to the Internet and began magnesium research, and then I went to the health food store. They did not have Slow-Mag or the magnesium chloride (for insomnia) recommended in the Internet articles, so I picked up two different magnesium supplements, one with malic acid, and one with calcium and Vitamin D.

Both bottles prescribed about six tablets a day, but I calculated out the magnesium in each and took about 500 mg. the first few days. My muscle aches magically disappeared except for my sore jaw, which I suspect will take a while to heal. I feel better than ever. Not only does my body feel better, I am smiling more and being friendlier in those grocery store situations. And this in only two weeks. I have cut my Paxil in half, down to 5 mg a night, and now will try taking them every other night to wean myself from them and see if I see a change. If I *need* the Paxil, I will continue, but I suspect that the magnesium will do the trick.

This week in my continuing research I found your book listed on Amazon and went down to my local independent bookseller to order it. The good news for

you is that it was actually on the shelf!!!! I bought the book, have underlined parts and will be loaning and recommending it to my friends. My cousin suffers from fibromyalgia and panic attacks, another friend is frustrated in finding an answer to her migraines, and a male friend suffered a heart scare a couple of years ago, and I think magnesium might be beneficial for all of them as well. My father died at the age of 50 from a heart attack. He was a guy who loved life, but was very uptight, often barked at us for stupid reasons, used to get the same gagging reflex I had problems with, had become increasingly anxious and insecure, and used alcohol as a relaxant at the end of his day – not an alcoholic, but definitely a regular user. Magnesium might have saved his life as well.

And now for the undocumented side effect, perhaps a surprise to even you. I am sure this has to do with the muscle relaxation, but for the first time in my life I am having orgasms every time!!!! Well, at least four in a row and still counting.

Yes, this is embarrassing, but it is also amazing and I think you should know. After a week on magnesium I had an 'easy' orgasm. I never know whether I am going to go 'over the top' or not. Second time, I think, ' Gee, this is nice. 'Third time, I think, ' This is *weird*. ' Fourth time,' *It's the magnesium!!!!!!*

And I am on my third alcohol-free day, breaking a very bad habit. I feel great!!! And it all happened so quickly. Spread the word, Dr. Dean – Magnesium is a Miracle!!!”

Magnesium and Perimenopause

Rita almost couldn't believe it. She had been suffering heart palpitations for 10 years, along with hormone imbalance. She was amazed that her palpitations were gone in a few days.

“When I started reading your *Complement Now!* module on magnesium, I could clearly see the vicious cycle. Along with perimenopausal palpitations, I started to have retinal migraines as well as eye twitching. When I read your information a light bulb went on – it’s all related to a magnesium deficiency.

I see it this way: you have too little magnesium, your adrenals drop, which triggers hormones to go out of whack, and now we’re unable to handle stress; suddenly your heart starts palpitating, which only adds more stress. Now you can’t sleep, which all prompts magnesium to get even more depleted. Around and around it goes. Wow.

It’s fascinating. I went on the forums at [Power Surge](#) and the amount of women in premenopause or in menopause having adrenal rushes, palpitations, tremors, shaking, is epidemic. To think it may be possible that this simple use of magnesium could help prevent this . . . is incredible.

And you’re right, I do think the form matters. I cannot take most magnesium as it gives me diarrhea so I’ve avoided it. The transdermal and also glycinate in a pill form are really doing the trick perfectly.

I’m SO relieved to see these enormous health benefits. It’s really frightening to have your heart beating abnormally, which then sets off a whole chain reaction with stress, adrenals, hormones, etc, etc!

I think it “criminal” that the medical community is not informing their patients of this simple mineral supplement . . . or that they are not even up to speed on this vital information. I just want to say to you again, Dr. Dean—thank you from the bottom of my heart. Literally! :-)”

Magnesium and Sciatica

Annie shared the following story about her experience with magnesium.

"My name is Nancy and I have had a lot of trouble with the sciatic nerve which included my foot. I felt like my foot was swollen and many times I needed to remove my shoe. I had been to a foot doctor plus have had physical therapy but nothing seemed to help. I see a chiropractor on a regular basis.

It was my chiropractor who got me started on calcium/magnesium in powder form. I started taking it slowly, the amounts that were listed were one heaping teaspoon twice a day. But with my chiropractor's advice, I started with a half teaspoon and gradually added more until I was taking the amount that was recommended. I couldn't believe that it had helped the pain I was having with the sciatic nerve as well as the pain in my back, arm and shoulder area.

My husband was also having a lot of pain in his arm and shoulder area from a separated shoulder he had had surgery on many years ago. I started him on the powder and his pain went away. He couldn't believe how much better he felt. My husband is 67 years old and I'm 60. I recently ordered your book, *The Magnesium Miracle* and have started reading it. I find it very interesting in the fact that so many problems can occur from the lack of magnesium."

MAGNESIUM FOR THE ATHLETE

When you read about famous athletes from the past, you don't get the sense that they were following a healthy diet and lifestyle. Living large as a celebrity often means eating, drinking, and partying to excess— "eat, drink, and be merry" seemed to be their ultimate goal. Adding to the abuse on the body, intense competition led to the use and abuse of steroid drugs. In my consulting practice, I see the aftermath of years of steroid use—adrenal fatigue, obesity, diabetes, and heart disease.

The age of processed food made some athletes more aware of the lack of whole foods in their diet. We're still in the middle of the whole foods movement, and all manner of diets are now promoted to enhance athletic performance. The supplement industry, which is only about 30 years old, also became involved in promoting products to athletes. I don't know enough about all the ins and outs of sports supplements to say "yea or nay," but I do know about magnesium. It's *the* starting place for enhancing athletic performance.

Magnesium is a simple mineral that is often overlooked for the more sensational, sexy, and expensive supplements. A chiropractor, Dr. David Pascal, was interviewed in *Organic Connections* magazine in the Jan-Feb 2009 issue. He was a gold medalist in the 1983 World Games for the 1,500-meter run, and he has been in private practice since 1987. His clients include athletes at two Olympic Games, three World Championships, and 25 US Championships. Dr. Pascal's Beijing athletes won 20 medals: 10 gold, 5 silver, and 5 bronze.

Dr. Pascal's secret weapon is nutrition and a hefty dose of magnesium. His program is individualized, of course, but magnesium is the key nutrient that he recommends. Pascal says:

"Magnesium is actually the 'stress mineral' and is needed for about 350 different chemical processes within the body. By stress mineral, I mean that a body uses a lot of magnesium to handle physical stress, chemical stress and mental stress. Of course, athletes are under a tremendous amount of physical, chemical and mental stress, and so magnesium is absolutely vital for them to perform at their best."

Muscle Cramping

What do you find if you search for information about muscle cramping? Symptoms can range from a slight twitch, a joint pulled out of place, bruising on the skin, and

may require manual stretching to help release its hold. The most common cramping is found in the calf and the thigh.

Finding the cause of muscle cramping is still in the theoretical stage. Current theories include:

- Neuromuscular control imbalance
- New activity
- Muscle fatigue
- Dehydration
- Electrolyte depletion or imbalance
- Poor conditioning

Of course, I know that muscle cramping in athletes is mostly due to a lack of magnesium, and so does Dr. Pascal. As I mentioned earlier, magnesium is not recognized as an important electrolyte that needs to be replaced when there are losses due to stress, sweat, and poor diet. There is no accurate blood testing method to properly measure magnesium. It's not even recognized as a life-and-death factor in heart attacks, which are an extreme cramping of the heart muscle.

Presently, altered neuromuscular control (causing muscle fatigue and disruption of muscle coordination and control) is the prime candidate for the research funding in cramping. Dr. Martin Schwellnus, in an extensive 2009 literature review of muscle cramping, says that evidence supporting both the "electrolyte depletion" and "dehydration" hypotheses as the cause of muscle cramps is not convincing.⁷ It's not convincing, because there just isn't enough research available. Unfortunately, Dr. Schwellnus, who wrote *The Olympic Textbook of Medicine in Sport*, is

⁷ Schwellnus M.P. Cause of Exercise Associated Muscle Cramps (EAMC) — altered neuromuscular control, dehydration or electrolyte depletion? British Journal of Sports Medicine 2009; 43:401-408.

considered a sports expert, and his review will continue to prevent doctors and coaches from exploring magnesium for the prevention and treatment of muscle cramping.

In the meantime, Dr. Pascal, myself, and thousands of other doctors and athletes are convinced that magnesium works.

Each day we do experiments on our own bodies and prove its effectiveness. When I moved to Maui and started walking 1½ hours a day along the beach and swimming for a half hour to 45 minutes, I started to get calf cramping and heart palpitations that were previously under control with magnesium supplementation. I realized I was utilizing more magnesium with my extra activities and sweating more in the hot climate. I immediately increased my levels of magnesium and my symptoms were gone overnight.

Medical Treatment for Cramping

If you've suffered cramping, you've probably been told that:

1. They go away on their own
2. Stop your activity even though it may have already thrown you to the floor
3. Gently stretch out or massage the affected muscle

However, if you're an athlete who has fallen during a competition due to muscle cramping, that's not good enough. It's not good enough to be told that since we don't know the true cause of cramping we just don't know how to treat it.

Stretching and warm ups aren't going to improve your magnesium stores, because only magnesium can do that. Dr. Pascal says that many of the athletes that come to him have a history of muscle cramping. For him, it's the first clue that they are deficient in magnesium, and because he addresses the problem with magnesium, none of his clients suffer from cramping issues. Dr. Pascal says, "When I was in Eugene, Oregon, this summer for the Olympic Trials, I treated 40 of my athletes.

One of the things I really had to be concerned about was the heat and muscle cramping, and so I used magnesium preventatively. 'Take your magnesium.' That's the first thing I said when I saw the athletes in the morning and the last thing I told them at the end of the day. None of my athletes had muscle cramps—before, during or after their races." Many others did. It's the worst thing that can happen to an athlete and can result in muscle tears that can take them out of competition for a season.

Dr. Pascal is aware that, "Heat affects you because you will be sweating more. As you sweat, you're going to be losing magnesium, which is water-soluble. In addition, you'll be sweating out electrolytes, and, of course, water, too. These losses mean that the ratio of calcium to magnesium will be changing in the body: the percentage of calcium will increase; and since calcium is a muscle contractor, the muscles cramp and that's it." You may sweat out a tiny bit of calcium, but you sweat out much more magnesium—that's where the problem lies.

When you consider that water losses can be one to two liters per hour when training intensely in the heat, you can lose enough sodium, potassium, and magnesium that your clothes are encrusted with minerals. In military postings in the Middle East, soldiers talk about their T-shirts drying hard as boards with all the minerals they sweat out.

Any information on sweating just seems to focus on the salt losses, but it's not just about replacing water, sodium, and sugar, which is the content of most sports drinks. You also have to look at magnesium and potassium as being necessary elements in electrolyte replacement.

Dr. Pascal discusses the importance of minerals in general. He says, "...most people think that they have a problem with heat due to the high temperature or humidity. This isn't true. Heat builds up in the cells primarily because there are not enough minerals and electrolytes to carry the heat out of the cells. If there are

enough of these elements along with water, it wouldn't matter how hot it was—the cells would never overheat and people would never get heat stroke, because the minerals would transfer the heat out of the cells.”

Magnesium For The Athlete Stories

The following is an inspiring magnesium story contributed by Ben Greenfield - MS, CSCS, C-ISSN. Ben is one of the top fitness, triathlon, nutrition, and metabolism experts in the nation, and he's fallen in love with magnesium. See Ben at his website, [Ben Green Fitness](#).

How Magnesium Instantly Made Me A Better Athlete—Ben Greenfield

“I must admit that I was skeptical during the spring of 2009, when I first heard that more than half of American adults are deficient in magnesium, and even a greater percentage of athletes are deficient.

I was also skeptical when it was pointed out to me that a good number of cardiovascular incidents during exercise could be traced back to a magnesium deficiency, and that muscular fatigue, failure and cramping during exercise are not only related to sodium sweat loss or low calcium levels, but are just as much a function of magnesium deficiency.

After all, aside from using magnesium to produce brightly glowing flames during my undergraduate chemistry classes, my chief experience with this mineral had been glancing at the nutrition label of my vitamins and supplements, and seeing that the sparse 50-100 mg I was consuming would be close to 100 percent of my daily needs. Therefore, I must be getting enough magnesium.

No matter that myself and the large number of endurance athletes who I coach were frequently experiencing severe post-workout soreness, problematic muscle cramping during endurance events, and increased tightness, spasms and injury by the end of a long triathlon or marathon season. Sadly, none of my sports

nutrition certifications, coaching certifications or classes had placed any amount of emphasis on the fact that magnesium may be one of the contributing factors to these issues. All that was ever mentioned was sodium and water.

It wasn't until nearly a dozen of the nation's top natural physicians, sports nutrition experts, and alternative medicine practitioners, including Dr. Dean, consistently mentioned magnesium during my interviews with them on my online fitness blog and podcast that I began to pay closer attention. If this many respected medical experts were singing the praises of this miracle mineral, and warning of the deficiency dangers, then could there perhaps be an actual benefit of introducing magnesium into the nutrition protocols of myself and my athletes?

So, in the beginning of the 2009 race season, via topical application and oral supplementation, I gradually began to gradually increase my magnesium intake to 400-500 mg/day, and recommended this change to each of the athletes that I coach. I began taking magnesium baths after the more difficult workouts, and especially focused on increasing magnesium consumption during my high volume and high intensity training in the hot summer months.

As the 2009 season progressed and September approached, I personally came to the realization that I had not experienced a single muscle cramp in any race during the entire summer season. In contrast, previous years had seen me nearly withdraw from competition with severe calf and thigh spasms during longer competitions in the heat. Myself and my athletes who practiced my magnesium intake recommendations began to bounce back day after day for difficult back-to-back workouts that we never would have been able to accomplish. We were even sleeping better!

My most powerful realization of the importance of magnesium occurred at the end of the 2009 race season, when I literally laid it all out on the line in my final race, and crossed the finish line completely drained of all energy. This was the hardest I

had ever worked in any competition during the entire year. My breath began to come in short spurts, and my heartbeats felt irregular. My eyesight was blurry, and I was both nauseous and dizzy. I was scared. My single goal suddenly became to find a medical tent and IV as quickly as possible.

It was at this point that I remembered that in my race bag was my bottle of topical magnesium, which I typically only had applied prior to competition. I stumbled to my bag, found the bottle, and immediately began rubbing the solution onto my chest and across all my extremities. Within just 90 seconds, I could feel my body re-stabilizing and my energy returning. Just five minutes later, I was completely restored. The following day, my soreness was minimal—a very atypical feeling after having spent nearly five hours of high-intensity triathlon with my heart rate near 90 percent of maximum values!

Given magnesium's vital role in energy production and metabolism, it only makes sense that my performance and recovery instantly soared after I began magnesium supplementation. Fortunately, I stumbled upon this magic mineral early in my athletic career, and I can now look forward to many successful years of drawing upon magnesium as one of my secret weapons. To whoever is reading this personal anecdote: I encourage you to increase your magnesium intake prior to and after athletic competition. I guarantee that it will instantly make you a more successful athlete."

No Magnesium in the NFL

Simon was a body builder before he became an NFL football player. He was sidelined because he began experiencing disabling muscle cramping. When I first began to see him as a client, he had transferred his high stress athletic career into business. He probably experienced the same amount of stress in his executive position, with two teenage sons and a hectic travel schedule. He still had frequent muscle cramping as well as high blood pressure, obesity, and headaches.

I explained the importance of magnesium in stress and intense athletic performance that involves a lot of sweating. Simon said he sweated buckets playing sports and still does. Simon understood intellectually what I was telling him, but he said he had seen some of the best doctors and coaches, and nobody could help him. I think he had trouble believing someone he could bench press with one arm had the answer to his life-long problem. When Simon took magnesium, he became a believer. A good regimen of food-based supplements, ReMag, and Pico-Ionic multiple minerals got rid of his cramping, headaches, and high blood pressure. Of course, he wondered what would have happened if he'd learned about magnesium when he was still playing ball.

No Magnesium and Lots of Aspartame

Marjorie was a research scientist, a former athlete, and a very sick woman. Her previous athletic activity included running marathons and training nearly every day. Almost 15 years later, she came to me as a client with daily migraines, constant painful muscle cramping, and chronic paresthesia (a sensation of tingling, pricking, and numbness in her legs).

I explained to Marjorie about magnesium, and she got the picture. From her history, however, I found out she was drinking quarts of aspartame-sweetened iced tea every day. Because she would sweat so much, she got used to drinking lots of liquids, and now, she was addicted to aspartame. I told her about the neurological damage that can result from aspartame, so she agreed to stop it immediately and began taking a homeopathic aspartame remedy.

Marjorie's doctors told her she had a rare neurological condition and would need to take strong medications to see if the symptoms could be controlled. There was no guarantee that the medications would even work, so she decided to do an ExaTest to check her levels. Marjorie did have very low levels of magnesium and high levels of calcium. As soon as she began taking magnesium, her migraines improved. Next her muscle cramping stopped, and more slowly, her paresthesias began to heal.

Chalk It Up To Magnesium

Sid sent me a brief history of his success with magnesium, and I found it so fascinating that I asked for the whole story.

“Basically, I had insomnia for about 15 years and was painfully tired for about 350 days/year. I remember in 1972, I was Most Valuable Player all-around gymnast and in perfect health. In 1976 I was the A+ top Organic Chemistry student out of about 300 students in my class. About that time I quit gymnastics to concentrate more on my studies. But I started to develop insomnia and often felt very tired. In the 80's my insomnia became severe and I tried everything to sleep, but nothing fixed the problem.

I always thought my body needed that gymnastics-type workout. So, whenever I had enough energy, I would work out for hours. I tried medicine, vitamins, and improved my diet, but nothing cured the insomnia. After six sleep clinics, I became the so called 1 percent that can't be cured.

After trying almost every medication available, my favorite sleeping meds were Remeron 30 mg and a very low dose of Seroquel 25 mg. Actually, they work pretty good but have some minor side effects. Like Remeron makes you want to eat the bark off a tree – so you'll gain weight. However, it feels like these meds only partially fixed the problem and partially masked the problem. I just wished I was healthy like when I did gymnastics.

A couple years ago, when I went for my 50-year colonoscopy, the anesthesiologist told me he had to give me more anesthetic because of the sleep meds I was taking. He also told me he had insomnia for years and cured it with magnesium. Then I remembered years ago a chiropractor recommended a very high dose of magnesium for my insomnia, but the next

day's diarrhea put an end to that suggestion. I threw that magnesium powder in the trash.

After my colonoscopy, I googled about magnesium and insomnia, and found people had success with approx. 300 mg three times/day. I tried a variety of magnesium tablets, capsules and powders. My sleeping improved within two days and I didn't mind suffering through a little diarrhea. Then my sleep kept improving and I just couldn't believe it! I could sleep. I had energy. I could work out like I was 18 again. I increased my workouts to include a rigorous regime of weightlifting, aerobics, karate, running and a variety of other exercises. I just wished I could find access to gymnastics equipment.

Recently, one of my friends opened up a gym for tumbling. I picked up a nice pair of wooden rings on eBay and we hung them up in his gym. Of course we needed chalk so I got online and ordered a few blocks of gymnastics chalk.

I ordered three pounds of premium grade, Taiwanese magnesium carbonate white chalk, which comes in soft cubes that are easily crushed to make powder. Suddenly, I knew the rest of the story - OMG - gymnastics chalk is magnesium and that magnesium powder in health food stores is just like gymnastics chalk.

So why was I so healthy when I was a MVP gymnast? Was it the great gymnastics workouts or was it the chalk or both? I remember inhaling that stuff for hours on end during my gymnastics workouts. My black hair, my clothes, hands, feet, eyes, everything was covered with a thin layer of powdered chalk. I ate snacks with chalk on my hands; I just got so used to the daily smell and taste of gymnastics chalk.

For about 30 years, I thought my insomnia was partially due to the lack gymnastics. But now I know; my insomnia was due to the lack of gymnastics chalk!! I'm chalking up all the time now!!"

MAGNESIUM Q & A

1. Can magnesium make low blood pressure even lower, since it can relax muscles and blood vessels?

Answer: In the 10 years that I've been researching and writing about magnesium, I've had two young female athletes tell me that they felt faint after beginning to take magnesium. One woman, after taking one of her first doses of magnesium, went to the gym to work out. She said she experienced light-headedness and faintness. When one of the trainer's took her blood pressure, it was 90/60. Her normal blood pressure is 100/70. She was sure the low blood pressure and faintness were from the magnesium.

I'd like to hear if any other people have had this experience. As I mentioned, it doesn't seem to be a common experience. Doing a Medline search for magnesium and low blood pressure brings up studies that show the benefits of magnesium in people with high blood pressure. In my experience, people with low blood pressure are sensitive to fluid intake, supplements, changes in their diet, and medication. Therefore, when beginning any new supplement, go slowly. With a supplement, like magnesium, that affects all the muscles in the body, it was probably not a good idea to take a dose and work out without knowing the body's reaction. However, magnesium is a necessity for athletes. The stress of athletic activity, sweating, and muscle exertion can cause magnesium depletion.

As a practical solution for people with low blood pressure, I recommend taking magnesium and calcium together or taking ReMag spray instead of an oral magnesium to minimize the immediate relaxing impact of magnesium in the blood.

2. In the first edition of your book, "Magnesium Miracle," you say not to take magnesium with a meal. My bottle of magnesium (as magnesium oxide) tells me to take it with a meal. What is the correct thing to do?

Answer: Magnesium oxide is only four percent absorbed. Therefore, 96 percent of it flushes through the intestines as a laxative. The suggestion to take it with a meal will slow it down somewhat so more can be absorbed. However, I don't normally recommend magnesium oxide in the amount you have to take in order to get enough magnesium absorbed, since taking care of symptoms with a dosage that large will usually give you a laxative effect. That may be beneficial to someone with constipation, but having two to three loose bowel movements a day can flush out too much magnesium as well as other nutrients. ReMag is so well absorbed that it doesn't matter whether you take it with or without food.

3. I have a question about magnesium oil: the only place I can spray it where it doesn't sting more than I can stand is on the soles of my feet, but when I do this, I break out in an itchy rash all over my upper legs and abdomen. Even when I dilute the oil several times, I get this response. It calms down after several hours, but I'm wondering if I should I be concerned about this. Is this "normal" for someone who is apparently very (based on what I've read in your book and in other sources) magnesium deficient?

Answer: Magnesium oil isn't oil at all. It's magnesium chloride (from sea water), supersaturated in distilled water. The concentration of this oil can be up to 3,000 mg per teaspoon. That's pretty concentrated; it's like salt brine, and it can sting like a very strong salt solution. When people have this reaction, they may have to use 10 parts water to one part magnesium oil to see if it's just the concentration that's the problem. Getting an itchy rash away from the soles of the feet like on the thighs and abdomen,

is very unusual. An itchy rash implies an allergy but it can also be the detoxification of heavy metals or yeast toxins being eliminated with the detox being caused by magnesium. I advise people to spray ReMag on the skin to achieve the same or even a greater effect than magnesium without causing a rash or irritation.

I don't think I've seen any allergic reactions to magnesium, but the human body is so amazing, anything is possible. What most people experience with magnesium is often an immediate (within 48 hours) improvement in one or more symptoms, and other improvements often continue. However, there can be detox reactions or healing reactions that occur, such as the following:

- a. If a person has mercury fillings, it's possible that magnesium is detoxing mercury from mouth tissues, and this is showing up on the skin although it should be short lived (one to two weeks). An individual can hasten the detox by using magnesium oil or having salts baths, and by taking oral bentonite clay to absorb toxins.
- b. If a person has acne or acne rosacea for which they are taking medication, the skin could react with rashes and itching as the skin is acting as a detox organ.
- c. In a more general sense, magnesium can start revving up the body's "motors" in all the 700-800 enzyme systems for which magnesium is the ignition key. When that happens, things can look very rosy for a short time, then the body can slump, because it actually wants more and more magnesium.
- d. If you take more magnesium while getting loose stools from it, you can be losing as much as you take. At that point, you should switch to non-laxative [ReMag](#), which you can take orally and/or use it transdermally as a spray.
- e. If after a few months you feel a slump or some twitching or cramping comes back, that can be an indication of a need for calcium. Then you should add a calcium magnesium product that has more magnesium than calcium.

4. Hi Dr. Dean, I bought your book and have started taking a magnesium citrate powder this past week. I am also taking a prescription for Pristiq, for anxiety. Is it safe to be taking the magnesium with the Pristiq, since both are supposed to produce serotonin? I'd love to stop taking the Pristiq, but as you know, you can't suddenly stop taking it. Thanks.

Answer: I looked up Pristiq in an online drug manual; it is an SSRI (serotonin reuptake inhibitor) antidepressant with an off-label indication for anxiety. About 90 side effects are listed.

Magnesium helps in the production of serotonin only when it is needed. Magnesium and serotonin work on a feedback mechanism, so serotonin is not made if there is already enough in the body.

SSRI drugs kill the enzyme that breaks down serotonin, allowing it to build up in the body. If an SSRI drug causes an elevation of serotonin, magnesium won't make more because of the feedback loop. The same can't be said for the SSRI. Magnesium does many things beyond helping to make serotonin to balance your mood. It supports the adrenals, slows down the nervous system, and creates muscle relaxation. Magnesium is very beneficial for someone with anxiety - on or off drugs.

5. Can children and pregnant women take the mineral magnesium?

Answer: This is a great question. Magnesium is absolutely necessary for a healthy pregnancy. It should be a requirement like folic acid, which prevents spina bifida. Magnesium prevents constipation, fluid retention, high blood pressure, and all the symptoms of eclampsia. Midwives used to call magnesium "the salts". They probably used Epsom salts in baths. However, it's not safe to take Epsom salts by mouth; it's not food grade and can be contaminated with heavy metals. For children, you can put ½ to 1 cup of Epsom salts in a bath, or if you want a completely pure source of

magnesium, use 1-2 ounces of [magnesium oil](#) in a bath. The magnesium in Epsom salts and magnesium oil will be absorbed through the skin.

6. I recently read your book, "The Magnesium Miracle," and began implementing magnesium oil supplementation. Huge change! I feel great, my energy levels are much higher, and I have an overall feeling of wellbeing. Thank you. Just had a quick question though. Would magnesium chloride (in powder form) absorb in the skin the same way magnesium oil does? Just trying to think of creative ways to give magnesium to the kiddo. Maybe I'll add it to the baby powder.

Answer: For children, it's probably best to put magnesium in a bath. Powder on the skin is not likely to be absorbed. You can use ReMag spray on a child, as it's less irritating than magnesium oil.

7. I have a question. Can taking magnesium (about 200 mg) two hours before bedtime cause insomnia at first? I have had a real difficult time falling to sleep the last two nights since I began taking magnesium citrate in a powder form.

Answer: As I mentioned in Question #3, if magnesium has been deficient for some time, when you begin to take magnesium, it can start revving up the body's "motors" in all the 700-800 enzyme systems for which magnesium is the ignition key. If you take your magnesium at night, hoping for sleep, it might give you more energy as the 700-800 enzyme systems are activated when your body is trying to slow down for sleep. However, that will pass.

8. I was told that, if I take Ativan (half a .05 pill a day), that I cannot take magnesium, because it will interact. Is this true? I would like to take magnesium.

Answer: I looked up Ativan in my online drug book and searched three areas: Doses, Uses, and Warnings; Detailed Monograph; and Patient Handout. Nothing was said about an interaction between magnesium and Ativan. I did see a list of 56 side effects however.

The only possible interaction I can see is that, if you take magnesium with Ativan, you would end up needing less Ativan, and hopefully, you would eventually need no Ativan when you take magnesium to calm anxiety and nervousness!

9. In February, I was given a prescription for a heartburn medication that has made me anxious and ill ever since. I thought I was losing my mind. Until yesterday, I had no idea that it could be related to the medication. I purchased your book and I was searching for information online and stumbled across many people struggling with the same symptoms. I believe that, due to the medicine (a proton pump inhibitor), my body has not been properly absorbing vitamins and minerals, including magnesium. I also suspect I have yeast, since I took lots of antibiotics. It could be the culprit for the heartburn I've been experiencing that the medication was supposed to correct in the first place. I have struggled with panic attacks off and on since I was a teenager, and I'm now in my early thirties. Off and on through that time, I was taking some sort of prescribed stomach medication. Could these drugs be making me anxious?

Answer: I've had more clients in their twenties and thirties consulting me for symptoms of anxiety and panic attacks recently. Their stories include years of antibiotics, antacids, and proton pump inhibitors (PPIs) that have thrown their bodies completely off balance. PPIs even have an FDA Black Box Warning that they lower magnesium! At this stage, it takes more than just a few doses of magnesium to undo the damage. Proton pump inhibitors shut down the acid-making ability of the stomach. Without acid, the stomach contents don't get digested properly. The food begins to ferment in the stomach and causes reflux and heartburn. Minerals aren't properly converted to an absorbable form in the absence of stomach acid, so the deficiencies begin. Symptoms worsen when drugs are used to treat more symptoms, as most of these young people end up on antidepressants and anti-anxiety medication.

On top of all that, most of the commonly prescribed drugs contain fluoride to try and make the drug stronger. It may do that, but it also binds up magnesium, making it unavailable to the body! You have to take much more magnesium in order to overcome the losses caused by these prescription drugs.

10. I've started using magnesium oxide capsules and I could not keep my eyes open. It made me tired all day.

Answer: I've gotten many variations of this question throughout the last 10 years. I think that people who really need magnesium, as shown by their symptoms and checking off several of the magnesium factors, can have such a deficit that in the beginning it's like they can't get enough of it.

However, taking magnesium oxide, which is only four percent absorbed, is like teasing your body. It's not going to get as much as it wants without causing a laxative effect. You begin to prime the pump with magnesium oxide, you turn on the 700-800 magnesium enzyme systems, and the body starts gearing up, but then there isn't

enough magnesium being absorbed to follow through on all the jobs you just started. See the various types of magnesium in the section, [Different Forms of Magnesium](#). Taking magnesium citrate powder in water throughout the day will give you a higher absorption. Taking ReMag will give you almost 100 percent absorption, and it should help break through the initial tiredness as your magnesium stores build up.

Another way to look at initial tiredness with magnesium is that, since it's a detoxifying cofactor for the liver, you could be going through a natural healing reaction phase. As your body is eliminating toxins, you feel tired and just want to sleep. The best way to handle this type of reaction is to sleep as much as possible, drink lots of water, and encourage detoxification through the bowels by using psyllium seed powder and food-grade bentonite clay.

11. I've developed an arrhythmia. My doctor started me on Bystolic for my blood pressure and is suggesting Coumadin. I usually take magnesium with my calcium. I've started taking a magnesium supplement separately. Do you think it will help with the arrhythmia? What do you think of the Bystolic and Coumadin? Bystolic is lowering my blood pressure, but not helping the arrhythmia. Any input would be appreciated.

Answer: Although I can't answer personal health questions, I will give some general answers. Bystolic is a beta blocker that slows the heart rate and decreases the muscle contractility; it also relaxes blood vessels, and it is mostly used for blood pressure. Magnesium does all these things—and more. Magnesium should always be the first line of treatment for arrhythmia and blood pressure. At the Nutritional Magnesium Association, you can view the video called, [The Balance Between Calcium and Magnesium](#); just click on Videos. When there is too much calcium relative to magnesium, the heart gets irritable and can produce an irregular heartbeat.

Coumadin is the treatment doctors use to prevent blood clotting. Magnesium also works on this level by detoxifying the blood to keep it from becoming too “thick”. It is also a mild blood thinner, but doesn’t work the same way as Coumadin, meaning that people can take both without side effects.

12. I’m writing about my husband. He has all the symptoms of being magnesium deficient, and I would like to have him start taking it. My concern is the medicine he is already taking for his problems. The doctors say he has heart failure, which was diagnosed two years ago. He is diabetic (insulin dependent) and has always had a lot of fluid retention in his legs. These are the medications he is taking: Protonox, Furosemide (Lasix), Digoxin, Diovan, Potassium, Coreg CR, Simvastatin, Coumadin, Aspirin, Insulin Humalin, and Humalog. I wish you had a practice here in our area so we could go and talk with you.

I wrote to you about my sleep problem three weeks ago. Hope to hear from you about my husband’s dilemma with all the meds he is taking.

Answer: I’m sorry to hear that your husband is having such a hard time and is on almost a dozen medications. If someone is taking potassium, then they surely need magnesium. They are both kicked out of the body by diuretics like Lasix. You notice I say “someone”. I can’t diagnose or prescribe in my writing, but I do know that magnesium is a very safe mineral and a life-saving mineral. It’s as safe as taking potassium. It’s probably safer than potassium, actually, because if you take too much magnesium orally, then your body gets rid of it by giving you loose bowel movements. When people are on so many meds, they start taking magnesium very slowly, leading them to then find that their doctor can lower their drug intake. As you know from reading my book, magnesium can strengthen the heart, lower blood pressure, lower

blood sugar, lower cholesterol, and thin the blood. Since it can do all those things, people who are on so many meds should inform their doctor that they are going to take magnesium to help their body and help reduce their drug intake.

13. Please remind me of the “physiologically desirable” ratio of calcium to magnesium. Most people are consuming drinking water that comes from either surface sources—which are relatively depleted in both calcium and magnesium—or deep groundwater sources which – tend to contain too much calcium (depending on the geochemistry of the specific bedrock unit) or too much sodium from the exchange of both calcium and magnesium that takes place in water softeners and that is harmful to the heart.

Answer: Many of the epidemiological studies about the benefits of magnesium come from studying people's health and what kind of water they were drinking. In areas where the water is high in magnesium, there is less heart disease. In areas where calcium is high, there is more heart disease. As for the best ratio for the intake of calcium and magnesium, the jury is still out. There are so many factors involved that it's very difficult to set a standard ratio. As I wrote in *The Magnesium Miracle*, magnesium comprises about two percent of the earth's crust and 1.14 percent of seawater. Calcium makes up three percent of the earth's crust, but it makes up only 0.05 percent of seawater. Right there we know that calcium is a much harder mineral because it doesn't dissolve in seawater nearly as readily as magnesium. I've made the point many times that calcium doesn't dissolve in the bloodstream without the help of magnesium.

Magnesium makes up about 0.05 percent of the body's weight, but the proportion is much larger for calcium weighing in at two percent. The amount of magnesium in bone is only 2-2.5 percent. Approximately 70 percent of bone weight is accounted for by calcium phosphate crystals. Calcium constitutes a larger

proportion of the body weight (about two percent) than does any other of the “inorganic” elements. It is very unevenly distributed in the body; over 99 percent of the total amount being in the bones.

14. Thank you, Carolyn—you are truly an inspiration! I am learning so much—where else can one find such valuable information and be able to trust it? I have one question about magnesium: I started several years ago taking magnesium chloride for restless legs (believe it or not a doctor recommended it) and realized it was also a good laxative, so I have continued taking it (they grind it at my drug store). Everyone seems to refer to magnesium oxide, so I'm wondering if this is a good idea to continue taking this form?

Answer: Magnesium chloride is a very good source of magnesium, much like magnesium citrate, but the taste is stronger, therefore it's not used as much as magnesium citrate in the US.

A doctor friend of mine in Peru has a magnesium company, and he uses magnesium chloride in his products exclusively. Magnesium oxide is only absorbed about four percent. There really aren't enough proper absorption studies to know exactly the absorption of magnesium. From clinical experience I suspect that magnesium chloride and citrate are absorbed at about 20 percent. What's not absorbed can become laxative.

When people get too much of a laxative effect, I recommend oral ReMag and ReMag spray. Because it's 100 % absorbed at the cellular level, it has no laxative effect. More research should be done on the absorption rates and percentages of all the forms of magnesium, but thankfully, people are hearing about magnesium, using it, and finding out about its health benefits.

15. I think I used transdermal oil last night for the first time, and I think I used too much. I could not fall asleep. I did not have this problem with magnesium citrate powder. I took them both together last night. I have not taken calcium in a while. I thought maybe that I had taken too much magnesium without calcium, so I took 300 mg calcium citrate. I woke up with a leg cramp! That has not happened in weeks. Should I just get my calcium from food for now?

Answer: Read the section, [When Magnesium Makes Me Worse](#), and read my ReMyte book for the food list that will show you how you can get all the calcium you need from your diet. My ReMyte book is called *Invisible Minerals Part II – Multiple Minerals*, and is available as a free download under the INFO section at [RnA Reset](#).

16. Thanks for a great book. I have read it over and over to make sure I don't miss a thing. I am a little confused on when to add calcium after starting on magnesium. In your book you recommend to start calcium after three months on the magnesium. I am afraid to take calcium. Last week I took two antacids (a calcium carbonate), not realizing the high dose of calcium, and my feet and legs cramped for days. Could you please give me advice on introducing calcium again? And can they be taken together? For now I have been trying to eat food sources with calcium and I'm keeping a log.

Answer: Calcium and magnesium intake is very individual, and there hasn't been enough research on this or on the various rates of absorption of magnesium from foods and supplements to give a definitive answer.

Also, in our diet, we obtain much more calcium from foods than we do magnesium. In produce, calcium and magnesium are found together, so I don't hold to the notion that, as supplements, they should be taken apart.

You can check lists of calcium-rich foods and get an estimate of how much you might be getting in your diet. It's usually in the order of 500 mg per day for calcium in a good diet, but only about 150 mg per day for magnesium. That's why I often recommend that people start by taking a magnesium supplement, and that they just eat enough calcium-rich foods to meet their calcium requirements of 500-700 mg per day.

It's very difficult to judge symptom relief when you just take calcium; when you first begin to take it, you can actually feel it's helping your magnesium deficiency symptoms because, to keep a balance, the extra calcium is forcing magnesium out of storage. However, after a few months on magnesium alone, if you don't feel you are getting enough calcium from your diet, you can start taking calcium, but in a ratio of two to three parts magnesium to one part calcium. I mainly recommend angstrom calcium in an effort to avoid the build-up of calcium that can occur with other forms.

17. Magnesium seems to bother my stomach, giving me diarrhea. I mostly use magnesium malate. I tried magnesium gel, but it is sticky and doesn't feel like it absorbs. I was diagnosed with ulcerated colitis, and before that, any NSAID bothered my stomach. MSM is the only pain supplement that helps. Any suggestions for another magnesium?

Answer: Personally, I have a problem with oral magnesium causing loose stools. Also, when I was researching for my book, *IBS for Dummies*, I realized I had to find some form of magnesium that would not cause a laxative effect. I found magnesium oil applied to the skin to be a non-laxative product, and I wrote about it in the second edition of, *The Magnesium Miracle*. Then I discovered Pico-Ionic minerals. You can read

about these two non-laxative forms of magnesium in the section, [Different Forms of Magnesium](#).

18. I came across your book and website and started taking magnesium (250 mg x 2 per day). However, one of the side effects that I am getting is a flushing and redness of my face. Is that normal? Will this go away?

And a similar question:

I just finished reading your book, The Magnesium Miracle, and loved it. I started taking magnesium citrate powder, but after the second day, my face got red and blotchy. Nowhere in the book could I find any information on possible negative or allergic reactions to magnesium. On a good note, my foot cramps and twitching are gone!

Answer: I don't know specifically what's causing the flushing/redness of your face with magnesium, but I do know that when I've had IV magnesium, I get that reaction, just like many people do. When flushing is specific to a certain body part, I wonder if it's the magnesium flushing out toxins from that particular area. The face is often targeted because of old dental anesthetic stored in tissues or dental amalgams with mercury.

19. I have read a lot of information lately about the importance and benefit of taking malic acid with magnesium for fibromyalgia. You haven't mentioned it in your blog. What is your comment on malic acid?

Answer: I speak about the magnesium malate studies in my book. The malate part of the compound is derived from malic acid, which comes from apples or can be made in a lab. Malic acid is a chemical that is involved with energy production. It seems to

be helpful to some people, but I've never seen great improvements in fibromyalgia in patients using malic acid as a supplement, whereas I have seen great improvements when people are taking enough magnesium.

20. Please comment on the effects of magnesium stearate as a “filler” in so many supplements.

Answer: Magnesium stearate is a compound created by combining stearic acid (a product of coconut oil or palm oil) and magnesium. It's a white substance and just like coconut oil it melts at about 88°C. It's regarded as entirely harmless, is not absorbed and really has no effects on the body in the small amounts that are present. Magnesium stearate is used for its lubricating and no-stick properties to prevent manufacturing ingredients from sticking to equipment during the process of compressing of solid tablets. So, you'll often see the name on your supplement labels.

21. I have a question relating to magnesium citrate powder. A friend is going through thyroid balancing with her doctor. She would like to take magnesium, but was told not to have any mineral supplements until the thyroid was balanced. Why would it matter if she does?

Answer: I can't think of any reason why a person on thyroid medication should be denied minerals. However, in spite of the epidemic of iodine deficiency and hypothyroidism in the U.S. and possibly around the world, doctors seem to be afraid of iodine. Therefore, her doctor may have wanted to warn her against iodine, but cast his net over all minerals.

I take the opposite view. Magnesium supports the thyroid, but so do a total of 9 minerals – that we know of. In order to offset the mineral-deficiency causes of low

thyroid, I recommend my multiple mineral, ReMyte, which contains all 9 minerals. People using ReMyte have found it so effective that they have been able to wean off their thyroid medication as their thyroid comes to life with necessary mineral building blocks.

23. My question is, I have a mom that is in the nursing home, and her doctors don't believe in supplements, much less fungus in the intestinal tract, even though after being scoped the doctor said she has yeast all the way down her esophageal tract. My question is: would it be okay to give her olive leaf extract, grapefruit seed extract, garlic, fish oil, probiotics, etc.? She takes meds for numerous health issues, diabetes which is out of control, and the doctor says it's fine in the 200's and 300's! She [also] has heart problems, angina, and anxiety. She takes Paxil, Zantac, and Remeron. Whoa, right!! She also takes Digoxin, Mylanta, and drinks Pepto Bismol like it's going out of style. Plus, she takes Advair, because she can't breathe. She currently is being treated for Clostridia. Her stomach really hurts. I think all the meds and intestinal fungus are to blame. I tried to get her doctor to prescribe Nystatin, but he won't. Any suggestions? She needs help. I really think they are trying to kill her. She is 78 years old.

Answer: Most people in nursing homes need magnesium, multiple minerals, and the antifungal, Nystatin. I can't tell you whether it will be okay or not to use the supplements you suggested with your Mom but it's very likely that your efforts will be blocked by the staff. I can't tell you what to do but, personally, I would put ReMag in a skin cream and rub her feet and hands. Some family members will bring in drinking water in which they have put ReMag and ReMyte. Then you watch as improvements happen while trying to get the doctors to cut back on prescription medications. There

is much evidence of elderly patients going on “drug holidays” and showing great improvements in mood, memory, and physical symptoms.

24. I take my magnesium at mealtimes with my food. Is this the best way to take it to receive the maximum absorption?

Answer: Magnesium that causes a laxative effect is best taken with meals, because being combined with food slows down its digestion, and, therefore absorption. This way more gets absorbed into your tissues and less stays in your intestines to cause a laxative effect.

LEARNING MORE & ASKING QUESTIONS

Every day, I learn more that I'd like to share about ReMag. I will keep updating the book; this is Version 9. For more about ReMag, as well as ReMyte, ReCalcia, ReAline, ReStructure, RnA Drops, and ReNew, join me on [Dr. Carolyn Dean Live](#) for my weekly two-hour radio show. It's on Mondays at 4pm PST on Achieve Radio; just click on Studio A. Listen for the best way to use these products and hear amazing personal testimonials. You may even become an amazing testimonial yourself!

You can search the archives of my radio show for the topics of your choice on the [RnA ReSet](#) website, under Blog/Radio. You can find complimentary copies of my ReMag, ReMyte, ReStructure, AFib, and Anxiety books at RnA Reset also under the [Blog/Radio](#) link.

APPENDIX A: MANUFACTURER'S WORDS ON REMAG, REMYTE, AND RECALCIA, PICOMETER, STABILIZED IONIC MINERALS

"To understand how ReMag and ReMyte are created requires a basic knowledge of the chemistry of ions, ionization, ionization potential and mineral absorption. Some basic Google searches using the above key words will provide the necessary background information.

ReMag magnesium and ReMyte minerals are in the same form as found naturally in our food. All these minerals are liquid, ionic, monatomic (individual ions of minerals in solution) and can be described as picometer in size. There is no nanotechnology involved. Picometers are units of measurement, nothing else. (There are one quadrillion, 1,000,000,000,000,000 picometers in a meter.)

ReMag and ReMyte are not just ionic solutions. Ions are a charge, not a size. Ions in solution can still form large complexes or lattice structures, which increases their size beyond that of an individual ion. They also have the tendency to bond with hydrogen and oxygen to form magnesium oxides and hydroxides, both of which act as antacids neutralizing stomach acid. They are also laxatives and difficult to digest, requiring digestive energy to be absorbed.

Our technology ensures individual ions in solution remain individual (monoatomic) and thus we distinguish them from weak complex ionic solutions by calling them picometer minerals. The size of an individual ion, when ionic and not bound as a compound or to other ions, falls in the picometer units of measurement. The size of the individual ion is determined by the nature of the element in question and its atomic weight. An ion of magnesium for example can only be as small as is allowed by the laws of Mother Nature. For example, we cannot make a single atom of magnesium smaller; we can only ensure that the atom does not combine with other atoms to form larger groups of atoms. It's the same with ions. The size of a single

monoatomic ion of magnesium is approximately 86 picometers. Our process ensures magnesium stays picometer-sized for maximum absorption.

The real secret of our process is that we control all the factors in the ionization process so that the finished product is a monoatomic picometer-sized ionic form of magnesium (as absorbed by roots systems of plants, released in our digestive system and absorbed into cells). The ionization process itself is complex but is no different than what occurs in nature every minute of the day.

To repeat, we don't allow the ions to bond into complex ionic groups or compounds that require digestive energy to break down.

How does nature provide minerals to the human body? When we eat food (the ideal most natural source of minerals) minerals are released from our food by the action of hydrochloric acid and gastric juices in the stomach. Essentially the digestive juices ionize the minerals in the food forming individual ions, not chelates or compounds or large clusters of ions. Ions are the basis of biological energy and function.

It is only after the ions are freed from food, that ionized minerals, which carry a positive electrical charge, will attach themselves to a very strong negatively charged carrier, via chelation, or a carrier protein. They are then either passed through the body or absorbed by the protein sites. Or they can pass into the intestine as unattached, positively charged mineral ions for absorption by ionic receptor sites.

An ion is any atom or group of atoms that holds a positive or negative electrical charge. Positively charged ions are known as cations (minerals form cations) while negatively charged ions are called anions. Ions are formed by the addition of electrons to, or the removal of electrons from, neutral atoms or molecules or other ions. It is generally known that in order for a body to effectively and completely absorb minerals, they must have an electrical charge attached in order to penetrate

cellular barriers. We want the mineral to be absorbed into the cell, not just into the blood stream.

This electrical charge exists surrounding the atom because the atom is either missing an electron or has additional electrons within its surrounding area. This charge causes the ions to interact, attracting or repelling each other in a search for another ion to contribute or remove additional electrons. It is the charge on the particle that allows minerals to activate the many functions they carry out within the body. But remember, an ionically charged mineral can still be in a complex that makes it too big to enter into cells.

Minerals are fundamentally catalysts, (reaction starters) and cofactors in metabolic processes because of their electrical charge. The fluid surrounding our cells is saturated with both cations and anions, as is the fluid inside our cells. Because of this separation of atoms with specific electrical charges, an electrical gradient, or current, is formed across the cell membrane. Because of this current that charged mineral IONIC particles can flow more easily across the cell membrane. The mineral must be in an ionic state for this to happen!

Ionic monoatomic minerals, of picometer size, already have a charge and size that the body recognizes and understands so they can be easily assimilated through the selectively permeable cell membranes from head to toe. Ionic monoatomic minerals are also easily transported across the highly selective cell membranes of the human digestive tract. Because ionic minerals are charged, the body has to employ less energy in order to absorb these minerals. However, some ions are bound to carrier proteins, or chelated, or complexed to amino acids and must be dismantled into smaller parts and obtain an electrical charge in order to cross the intestinal membrane.

The electrical (charged ions) gradient allows for the easy flow of ionic minerals from an area of higher concentration (digestive tract from mouth to intestines) to an area of lesser concentration (cells of the body).

The body absorbs monoatomic picometer ionic minerals with greater efficacy than other forms of minerals, as most other minerals must undergo the complete processes of digestion into smaller charged particles. In fact, the membranes lining our digestive tract maintain their own specific electrical charge in the form of ionic receptors. The body maintains this charge on the lining of membranes in order to facilitate the absorption of nutrients. Different receptor areas maintain different charge qualities, allowing for the attraction of the multitudes of nutrients that pass through the digestive tract.

It is our belief that supplying the body with minerals in the form that is equivalent to minerals in food makes the most sense since the stomach makes ionic minerals from food."

MEET THE DOCTOR OF THE FUTURE

Dr. Dean has been in the forefront of health issues for almost 40 years. She is not only a medical doctor, she is also a naturopath, herbalist, acupuncturist, nutritionist, intuitive, lecturer, consultant, author, inventor, capitalist, and purveyor of commonsense! She's authored and co-authored over 35 books, including *The Magnesium Miracle*, *IBS for Dummies*, *Hormone Balance*, and *Death by Modern Medicine*, as well as 110 Kindle books.

Dr. Dean is on the Medical Advisory Board of the non-profit Nutritional Magnesium Association. She was awarded The Arrhythmia Alliance Outstanding Medical Contribution to Cardiac Rhythm Management Services Award 2012, presented at The Heart Rhythm Congress, organized by the Heart Rhythm Society (HRS), Sept 23-26, 2012. In September 2014, she received an Excellence in Integrative Medicine Award at the Sacred Fire of Liberty Awards in Washington. You are invited to receive a free

subscription to Dr. Dean's Doctor of the Future Newsletter and join her online wellness program Completement Now!
